surrounded by an iron sleeve connected with the cam ring of the contact breaker, with which it moves when the latter is retarded; this sleeve is virtually a movable pole piece to the magnets, and so the "maximum position" is obtained through-

The Watford speedometer with new swivelling handle-bar clip.

In addition to the speedometers, a range of magnetos is exhibited.

POWELL AND HANMER, LTD., Chester Street, Birmingham (187).—The acetylene

P. & H. sid car lamp with concealed wiring lead to fit the mudguard or body side panels.

Speed-regulating clutch in the driving pulley of the P. and H. dynamo.

Regulation of output is obtained by means of a slipping clutch in the driving pulley. An unusual feature of the P.

Electric head lamps with cowl fronts are unusual, but the P. & H. is so fitted.

and H. electric head lamp is the cowed front.

ROTAX, LTD., Willesden Junction, N.W.10 (236).—No other British firm produces for motor cycle use a dynamo-battery ignition and lighting set like the Rotax Igdyno equipment; the system is popular in America, however. Although we have not had an opportunity of using this apparatus, it would appear to have many advantages, incorporating as it does the good qualities of accumulator ignition without the old-time defects. Other lines shown by Rotax, Ltd., are plain dynamo lighting sets and a big range of petrol taps, oil pumps, and motor cycle tool kits with special fasteners.

A dynamo battery ignition and lighting system: the Rotax Igdyno generator and distributor.

bulb holder being carried in a rubber diaphragm to minimise the effects of vibration.

M-L MAGNETO SYNDICATE, LTD., Coventry (200).—The designing department responsible for M-L magnetos is never content to rest upon its laurels. At the last Olympia Show the Maglita lighting and ignition equipment was just entering its stride, and it has been improved in slight detail since, while there is now a special lightweight set on which a very small battery is used. The ordinary magnetos also have been improved, and the

Accessories at the Show—

RUNBAKEN MAGNETO Co., LTD., Derby Street, Manchester (259).—New ideas

Combined spark gap and plug tester made by the Runbaken Magneto Co

are always expected from this progressive firm, and the exhibit is no exception to the rule. There is a flywheel magneto for two-stroke singles. The flywheel is of steel, brass being unnecessary in this design, and the coils are stationary; a standard type of contact breaker is fitted. Other Runbaken fittings are the

Unusual construction of the Runbaken Felco aluminium piston. The rings and gudgeon pin are carried in an "in cast" brass portion.

spark gap and plug tester, the double-spark plug, and a dimmer switch (with handle-bar control) for head lamps, besides the usual magnetos for single and twin engines.

S. SMITH AND SONS (M.A.), LTD., Edgware Road, N.W.2 (199).—Most important on this stand is the Smith lighting dynamo, which has an exceedingly simple

A neat motor cycle switchboard introduced by S. Smith & Sons. Ltd., for attachment to the top tube.

centrifugally-operated charging switch. M-L equipment and K.L.G. plugs are also prominent, while, in addition, there

Smith's float and screw petrol gauge and combined filler cap.

Handle-bar aneroid barometer and altimeter by S. Smith and Sons, Ltd

are Smith speedometers, handle-bar watches and aneroid barometers (altimeters), and a clock-face type of motor cycle petrol gauge combined with a filler cap. An excellent feature on this stand is a luxurious sidecar outfit equipped with dynamo lighting and every imaginable accessory, each item being indicated by a ribbon and label.

SPHINX MANUFACTURING Co., LTD., Bradford Street, Birmingham (208).—Twenty-one types of plugs are produced by this firm, which usually has an inno-

Air circulation around the central electrode is permitted by the lantern body of the Sphinx ventilated plug.

vation in plug design. Last year the bar type was shown; this year there is a new "ventilated" plug, in which the electrode is surrounded by air, the plug body being of lantern construction. A.C. plugs are also shown here.

C. A. VANDERVELL AND Co., LTD., Acton, W.3 (164).—C.A.V. magnetos are too well-known to need description, but the new lighting dynamo outfit should be examined. It is on conventional lines, but is characterised by neatness and sound construction, as might be expected

Neat universal handle-bar bracket of the C.A.V. head lamp

from a firm of car lighting specialists. The dynamo is a small cylindrical machine, and the switch box and ammeter are designed to clip on to the motor cycle top tube.

ACETYLENE AND BATTERY LIGHTING.

ALLEN - LIVERSIDGE, LTD., Victoria Street, S.W.1 (81).—Dissolved acetylene equipment for motor cycles. The chief speciality is the Fallolite projector, which gives a searchlight beam, yet, as demonstrated by recent R.A.C. tests, is free

Used with D.A. cylinders, the Fallolite head lamp set, marketed by Allen-Liversidge, Ltd.

from dazzle under proper conditions. The Fallolite lamp is shown with handle-bar bracket mounting a D.A. cylinder in the place of the usual generator. It only requires a universal cylinder exchange service seriously to challenge electric lighting with this outfit.

G. DAVENPORT AND Co., LTD., Clerkenwell Road, E.C.1 (229).—Motor cyclists who have envied lorry drivers their easily cleaned and substantial aluminium head lamps may inspect equipment of similar construction adapted for motor cycle use. Head, side, and tail lamps for either acetylene or electric lighting are shown. There is also the Impspecs speedometer, an ingenious device operated by the wind pressure of a small fan driven by the flexible cable from the road wheel.

A cast aluminium Davenport sidecar lamp of clean outline

Control by revolving vanes is a feature of the Impspecs speedometer marketed by G. Davenport and Co

Accessories at the Show—

ETIENNE ET CIE, LTD., Great Eastern Street, E.C.2 (316).—A tail lamp with detachable bulb holder, a handle-bar mirror, and the Stadium handle-bar spot-light mounted on a universal bracket are all items shown on this stand appealing to the accessory collector.

Speedometer lamp (the Nesthill), by E.H. Hill, Ltd., of Sheffield.

Stadium handle-bar spot-light made by Etienne et Cie.

ERNEST H. HILL, LTD., Broomhall Street, Sheffield (171).—For those who do much riding at night, the Nesthill speedometer lamp is an exhibit to be examined. It is simple and inexpensive, and in emergency may be used as a temporary head light.

A. H. HUNT, LTD., Tunstall Road, East Croydon (253).—For many years the Hunt speciality has been dry battery or accumulator lighting sets; the former are good for occasional use, and the latter are equally good under the like

Tinted bulbs obviate dazzle on this Hunt speedometer lamp.

circumstances if a ready means of charging is available. In detail several of the items exhibited have been improved, and the ball and socket handle-bar brackets for head lamps, introduced

Ball and socket bracket clips used on Hunt's electric head lamps.

at the last Show and described in these columns, are again on view. A large variety of switches, tail lamps, and

similar fittings are produced, and the speedometer light (a popular Exeter Run fitment) is also in evidence. A Hellesen dry battery hand lamp, of this make, which we use continually in the garage, still functions well after a year's service.

JOSEPH LUCAS, LTD., Birmingham (189).—Acetylene lamp sets and bulb horns of the concealed twist pattern are exhibited

Handy pocket screwdriver of Lucas make.

without alteration from previous models; indeed, the standard of excellence already attained precludes much change. There are also adjustable spanners and screwdrivers of excellent design, items that few practical riders can resist.

H. MILLER AND CO., LTD., Birmingham (195).—Despite having introduced a most excellent dynamo two years ago, with a

Miller's accumulator electric set with handle-bar mounting for solo machines.

unique system of regulation apparently devoid of the likelihood of trouble or derangement, this concern is apparently

(Left) Balanced pressure triggers on commutator brushes, and (right) rotatable wiring lead, on the Miller dynamo.

concentrating upon plain accumulator electric sets adapted for charging from an outside source. In acetylene equipment there is a new tail lamp with hinged burner holder, which can be

Hinged tail lamp of Miller make.

opened easily for lighting without risk of its accidentally coming adrift and being lost.

J. A. RILEY, Weaman Street, Birmingham (167).—A mixed display, in which accumulator lighting sets figure prominently; there is also a new Vita sparking plug for two-strokes and a quantity of tools and mascots.

HORNS AND SPEEDOMETERS.

CLAYTON-WRIGHT, LTD., Great Hampton Street, Birmingham (173).—Handle-

Clayrite handle-bar mirror with positive locking equipment.

bar mirrors and simply constructed electric and bulb horns are features of this exhibit.

COOPER-STEWART ENGINEERING CO., LTD., 11, Broad Street, W.C.1. (222).—An exhibit of speedometers and mechanical horns bearing the Stewart name.

COWEY ENGINEERING CO., LTD., Kew Gardens (263).—The latest Cowey accessory is the simplified mechanical horn operated by rotating a handle at the top. Its supplements, rather than supplants, the well-known press-down type of Cowey horn of polished aluminium. Cowey speedometers are also shown as usual.

Simple construction makes possible this cheaper model of the Cowey horn.

DEKLA, LTD., Hampton Street, Birmingham (79).—Bulb horns with concealed twists, Dekla electric horns (including a specially attractive one of polished aluminium), and

The Dekla electric horn.

the Dekalite lever-operated pocket torch are all items which will attract the motor cyclist.

R. E. VOISEY, LTD., Factory Road, Hockley, Birmingham (13).—An exhibit of bulb horns and accumulator lighting sets.

Accessories at the Show—

SIDECAR HOODS AND SCREENS.

APEX INFLATOR CO., LTD., Perry Barr, Birmingham (177).—Apart from inflators and similar small goods, the Thapex side-

A universally adjustable sidecar screen: the Thapex.

car windscreen and a folding hood are worth noticing; the latter may be packed up and stored under the sidecar seat.

AUSTER, LTD., Barford Street, Birmingham (318).—Exhibiting a sidecar apron and screen of unconventional construction, the apron covers the sidecar body

The Auster combined sidecar windscreen and apron; in the "down" position the screen is secured by a Lightning fastener.

as usual, and the screen is a central panel held in place by a Lightning fastener, which permits it to be erected quickly when required.

BLUEMEL BROS., LTD., Wolston, near Coventry (159).—On the Bluemel stand are shown some excellent sparking plugs, a variety of celluloid ware such as inflators, and the three-panel Bluemel windscreen for sidecars.

EASTING WINDSCREENS, LTD., Steelhouse Lane, Birmingham (147).—Easting

For lightweight sidecars the Baby Easting is an excellent weather protection.

screens have again been improved in detail, and they have done admirable work in increasing sidecar comfort generally. The metal fittings of the Royal model are now of stamped steel in place of the brass castings which were used upon earlier types.

OLLARD, WESTCOMBE, AND CO., Great Charles Street, Birmingham (176a).—The Cameo windscreen is shown this year

New leather-bound celluloid side wings are fitted to the Cameo windscreen.

with improved side panels of celluloid in place of the canvas side screen used previously.

COMPONENT PARTS.

ACCLES AND POLLOCK, LTD., Oldbury, Birmingham (210).—"Manipulators of weldless steel tubing" is the firm's own description of its capabilities, and a fitting one withal; wonderful things are done with tubing, and motor cyclists may see many tubular parts of their mounts in the "rough."

ALBION ENGINEERING CO., LTD., Upper Highgate, Birmingham (146).—Albion gear boxes are almost too well-known to need comment, but the new three-speed model, which was tested out in the T.T., Scottish, and English Six Days Trials this year, must not be missed. The gear is of the constant mesh type, but the

Clamped on to the seat-tube, the Albion three-speed control has an adjustable operating lever.

wheels run at low gear speed at all times. Special provision is made for taking up end thrust with putting pressure on the gearing; thus there is no drag on the pulley when the clutch is disengaged. A shock absorber is included in the clutch chain wheel when the box is arranged for all-chain drive.

BOWDEN BRAKE CO., LTD., Tyseley, Birmingham (234).—Hitherto specialising on handle-bars and Bowden control mechanism, a complete spring fork has now been added to the range of products. The suspension is controlled by C leaf springs, and designed for use with it is an expanding hub brake on straight-forward lines, operated by Bowden lever and wire from the handle-bar.

BOWDEN WIRE, LTD., Victoria Road, Willesden Junction, N.W.10 (266).—A

Radially acting front brake for use with a dummy belt drum.

radial action cable-operated front brake is shown suitable for use on any standard spring fork which will pass a dummy belt rim attached to the wheel. Other specialities are hand control for Philipson pulleys, an extra air device for motor cycle induction pipes, and the usual variety of wire-controlling mechanism.

BRITISH HUB CO., LTD., Weaman Street, Birmingham (216).—Exhibiting a range of hubs of all kinds, including chain-driven rear hubs and the well-known Carhubs for sidecars.

Chain-driven rear hub with expanding brake made by the British Hub Co.

BRITISH PISTON RING CO., LTD., Holbrooks Lane, Coventry (112).—Piston rings for all engines is the trading ideal of this concern. The name is indicative of the exhibit, and the exhibit is in conformity with the well-known high standard of goods produced.

BURMAN AND SONS, LTD., Ryland Road, Birmingham (179).—In common with other gear manufacturers, the innovation

The middle gear layshaft pinion of the Burman light three-speed box.

of the Burman concern is a three-speed lightweight box. It incorporates the well-tried Burman shock absorber, and operates on the constant mesh principle; the gear positions are locked positively inside the box by a ratchet quadrant device.

The heavyweight Burman box and the light two-speed gear are also exhibited.

E. DUBIED AND CO., LTD., Edco Works, Sheffield (232).—Spindles, nuts, and similar repetition turning in brass and steel.

HORTON HUB AND ENG. CO., LTD., Brearley Street, Birmingham (227).—Hubs of all kinds for sidecars and motor bicycles, including chain-driven models with knock-out spindles.

COVENTRY PLATING AND PRESSWORK CO., LTD., Coventry (260).—Hitherto catering for the trade only, this house is now prepared to undertake individual orders for specially wide mudguards to suit any machine. One speciality produced is a wide domed guard to fit Triumph machines, this particular fitment being in the hands of Clarke,

Accessories at the Show—

Wide front mudguard for Triumph machines, exhibited by the Coventry Plating and Presswork Co., Ltd.

Walters, and Co., of Little Park Street, Coventry, who are sole distributors.

MOSS GEAR CO., LTD., Thomas Street, Aston, Birmingham (50).—This firm shows at Olympia for the first time, and its reputation in the car world should result in its three-speed lightweight gear

The change speed lever and quadrant of the Moss gear, a device being incorporated to obviate any strain on the lever when the dogs do not mesh.

being studied with close attention. One of the most important features is the wide support given to the sliding middle-gear layshaft pinion, while the enclosed operating and safety changing device is excellent.

STONEHOUSE WORKS CO., Houghton Street, West Bromwich (203).—Showing footboards and footrests, including a spring-mounted variety of the former and many examples of motor cycle brake-work.

STURMEY-ARCHER GEARS, LTD., Lenton, Nottingham (161).—Chief feature of the Sturmeley-Archer exhibit is the new lightweight three-speed gear box, which, while retaining the familiar layout of constant mesh gears, with main and layshaft intermediate wheels sliding together, has been simplified by the use of the low gear wheels for the kick-starter train; by this method the three-speed box has no more

pinions in its construction than the standard two-speed and kick-starter box, which, it would appear, is likely to be supplanted in public favour, especially so as the former is only about three pounds heavier.

H. C. WEBB AND CO., LTD., Aston Brook Street, Birmingham (113).—This concern may well be said to have inaugurated a new era in contributing largely to the solution of the vexed question of front wheel brakes, for it has marketed an improved hub incorporating an internal expanding brake operated from the handle-bar by Bowden mechanism. Naturally, the Webb front hub and brake is the outstanding exhibit; but a back hub with expanding brake, for chain or belt drive and with or without shock absorber, is also shown. Another interesting item is the Mapleston fork, an invention developed in Australia, and already popular in this country. The construction is practically of steel throughout. The springs permit the absorption of shocks in two directions, and the link spindles work in bushed holes.

MINOR EQUIPMENT AND TOOLS.

BROWN BROS., LTD., Great Eastern Street, E.C.2 (162).

E. DANCE AND CO., LTD., Great Eastern Street, E.C.2 (168).

DUNHILLS, LTD., Euston Road., N.W. (68).

EAST LONDON RUBBER CO., LTD., Great Eastern Street, E.C.2 (250).

HOBDAV BROS., LTD., Great Eastern Street, E.C.2 (172).

MANUFACTURERS' ACCESSORIES CO., LTD., Great Eastern Street, E.C.2 (247).

The firms above-mentioned are, with the exception of Dunhills, Ltd., factors handling all kinds of accessories, garage equipment, and motor clothing exclusively.

A non-rattling stand-clip, named the L.B.C., and shown by Brown Bros., Ltd.

Obviously designed by a practical rider; a Dunhill glove, which gives freedom to the forefinger and thumb.

for the wholesale trade; the exception appeals to the private buyer also, and shows an excellent display of waterproof and leather coats, gloves, etc.

ABINGDON WORKS, LTD., Tyseley, Birmingham (225).—Apart from the 3½ h.p. and 6-7 h.p. Abingdon engines, there is a comprehensive show of excellent spanners—no need to name the King Dick in this respect—miscellaneous tools, and tank fittings.

DOVER, LTD., Northampton (265).—The fabrication of all kinds of articles in the celluloid-like Doverite and Exonite preparations, steering wheels, handle-grips, covered handle-bars, and inflators. A useful item is the Dover repair outfit for accumulator cases, containing strip and angle celluloid with the necessary cementing solution.

F. LINE AND CO., Buckingham Street, Birmingham (254).—A new belt fastener

Simple pressings form the two halves of the Linco belt fastener.

of extremely simple construction is a feature to be seen here; its connecting link is of dumb-bell shape, engaging in hemispherical cups formed in the portions secured to the belt. Another handy accessory is the Linco set of spanners, a number of thin steel keys being riveted together.

A useful set of Linco spanners.

PENNANT MANUFACTURING CO., LTD., Watery Lane, Birmingham (14).—Some

Four standard sizes of nuts are dealt with by this Pennant spanner.

very practical tools are shown, including an aluminium-handled screwdriver and a useful "four-size" open-ended spanner; both these items will be coveted by

practical motor cyclists. Another good thing is a mechanical horn with trumpet screwed into the body, thus dispensing with a ring of small screws and giving a clean (and cleanable) exterior.

A useful chain rivet extractor, the Pennant.

HERBERT TERRY AND SONS, LTD., Red-ditch (185).—Besides every variety of spring used in motor cycle construction, an innumerable

In a slightly modified form, the Terry spring saddle is here shown arranged as a pillion-seat.

host of what the Americans call handy "kinks" are shown, ranging from spanners to pipe cleaners. Then there is the luxurious Terry spring seat, a super-saddle on the

Accessories at the Show—

Terry's Auto-Xtra automatic extra air valve.

hammock principle sprung on countless tension springs radiating from the centre. Another useful item is the check spring for sidecars, an easily-applied fitting which prevents all bouncing when the sidecar is driven empty.

BEARINGS, METALS, AND MATERIALS

ANTI-ATTRITION METAL CO., LTD., Victoria Street, Westminster, S.W.1 (315).—Bearing metals and bushes for engine and gear box use.

Complete crank-pin and big end roller bearing by Hoffmanns.

HOFFMANN MANUFACTURING CO., LTD., Chelmsford (245).—Ball and roller bearings for all motor cycle applications.

W. PETRIE AND CO., LTD., Tudor Street, E.C.4 (215).—Examples of Fibrax brake pads to suit all types of machines.

SKEFKO BALL BEARING CO., LTD., Luton (11b).—Self-aligning and normal

types of ball bearings. Also shown here is the Dureff four-speed gear box, in which the reductions are made through sprockets and roller chains. A very neat gate change is provided, and the single-plate clutch has both hand and foot control.

OILS, ENAMELS, PATCHES, Etc.

BRITISH OIL AND TURPENTINE CORPORATION, LTD., Chancery Lane, W.C. (235).—Speedwell oils.

CHALLENGE OIL CO., LTD., Stoke Newington, N.6 (198).—Challenge oils and carbide.

COUNTY CHEMICAL CO., LTD., Bradford Street, Birmingham (219).—In America, we are told, Chicago is a successful place

The Chemico blow-out patch. Method of fixing the spikes will be observed.

because it is the city of people who can. The Chemical people also can; they can anything that the motor cyclist uses provided it is possible to put it into tins; so we have oils, carbide, enamels, tyre

Enots grease gun with flexible connection (shown by the County Chemical Co.)

paints; solution, etc., etc. An item not to be overlooked is the Chemico blow-out patch for inserting in burst covers; it is an admirable get-you-home device.

ELEPHANT CHEMICAL WORKS, LTD., Neate Street, Camberwell, S.E.5 (257).—All kinds of tinned preparations used by motor cyclists: oils, grease, carbide, solution, etc. Hand soaps and brazing materials are also exhibited.

JENSON AND NICHOLSON, LTD., Stratford, E.15 (223).—A great variety of Robbialac enamels, invisible lacquer, aluminium paint, etc. The stand itself is beautifully finished in white Robbialac.

PATCHQUICKS PATENT, LTD., Tiverton (181).—Year by year puncture preventers, punctureless tubes, and so on, are invented, yet Patchquick flourishes in the Gallery just the same; everybody knows it.

PRICES CO., LTD., Battersea, S.W.11 (231).—Prices oils, Belmoline greases and hub lubricants, and Rangraphine graphited grease for chains.

SURRIDGE'S PATENTS, LTD., Church Street, Camberwell, S.E.5 (217).—Holdtite patches, acetylene gas bags and connections, rubber pads for clutch and brake pedals and aluminium side and tail lamps.

A new pattern "foot grip," by Messrs. Surridge's Patents, Ltd.

VACUUM OIL CO., LTD., Caxton House, S.W.1 (165).—Gargoyle Mobiloil oils and greases.

C. C. WAKEFIELD AND CO., LTD., Cheap-side, E.C. (178).—Castrol oils and greases.

SHOW TIME RECORDS.

JUST before the Show, there is usually a rush of aspirants for various coveted records. Crack riders congregate at Brooklands for special efforts to secure for their machines extra honours, and thus improve their Olympia propaganda.

This year has been no exception, as the crop of records given below will show. Chief among these is perhaps the 500 c.c. hour record, undoubtedly the most coveted. From the earliest days, this has been regarded as the blue riband of track achievements, since the 3½ h.p. machine has been the most popular type on the road for a good many years past. Soon after the track was opened, O. C. Godfrey, curiously enough on the eve of the Show, covered no less than 59 miles

1,350 yards in an hour, and his Rex machine was exhibited at the Stanley Show, Agricultural Hall, an interesting recollection of the exhibited machine being that it was displayed with a part-ridge which Godfrey killed during his meteoric ride. The first rider to cover more than sixty miles in as many minutes was Victor Surridge, riding a 3½ h.p. Rudge in May, 1911, his record standing for some considerable time.

This year the record has been broken several times, but last week's achievement of Major F. B. Halford, on a 499 c.c. Triumph with a Ricardo engine, is the first occasion that a four-valve engine has been credited with this honour.

The following successes were achieved just before the opening of the 1921 Motor Cycle Show:

NOVEMBER 22ND.

CLASS C (Solo).—50 miles: F. B. Halford (single-cylinder Triumph, 80.5×98 mm.=499 c.c.), 38m. 53.36s.=77.14 m.p.h.

NOVEMBER 23RD.

CLASS A (Solo).—10 miles, standing start: R. N. Judd (single-cylinder Velocette, 63×80 mm.=249 c.c.), 9m. 30.6s.=63.09 m.p.h.

NOVEMBER 24TH.

CLASS D (Solo).—50 miles: H. H. Bowen (twin-cylinder Martinsyde, 70×96 mm.=745 c.c.), 38m. 33.2s.=77.81 m.p.h.—125.22 k.p.h.

CLASS D (Solo).—One hour: H. H. Bowen (twin-cylinder Martinsyde, 70×96 mm.=745 c.c.), 77 miles 1,053 yards=77.58 m.p.h.—124.85 k.p.h.

CLASS F (SIDE CAR).—8 miles: C. G. Pullen (twin-cylinder Douglas, 68×68 mm.=499 c.c.), 4m. 25.6s.=66.77 m.p.h.—109.06 k.p.h.

CLASS F (SIDE CAR).—10 miles: C. G. Pullen (twin-cylinder Douglas, 68×68 mm.=499 c.c.), 9m. 2.4s.=66.37 m.p.h.—106.81 k.p.h.

CLASS C (Solo).—50 miles: F. B. Halford (single-cylinder Triumph, 80.5×98 mm.=499 c.c.), 38m. 49.4s.=77.27 m.p.h.—124.55 k.p.h.

CLASS C (Solo).—One hour: F. B. Halford (single-cylinder Triumph, 80.5×98 mm.=499 c.c.), 76 miles 1,301 yards=76.74 m.p.h.—123.54 k.p.h.

CLASS B (Solo).—Flying kilometre: G. Dance (single-cylinder Sunbeam, 75×79 mm.=349 c.c.), 25.6s.=87.38 m.p.h. Mean speed average two ways: 27s.=82.85 m.p.h.

CLASS B (Solo).—Flying mile: G. Dance (single-cylinder Sunbeam, 75×79 mm.=349 c.c.), 41.2s.=87.38 m.p.h. Mean speed average two ways: 43.8s.=82.19 m.p.h.

CLASS C (Solo).—Flying kilometre: G. Dance (single-cylinder Sunbeam, 85×88 mm.=499 c.c.), 23.8s.=93.99 m.p.h.

CLASS H2 (WITH PASSENGER).—Flying mile: E. B. Ware (twin-cylinder Morgan-Jap, 85.5×98 mm.=1,096 c.c.), 43.8s.=82.19 m.p.h.

R. N. Judd, who beat the 10 mile record in Class A on a Velocette. Speed 63.09 m.p.h.

F. B. Halford who, subject to official confirmation, now holds the coveted hour record in the 500 c.c. class. He rode a four-valve Triumph, his speed being 76.74 m.p.h.

Come and see the "COULSON."

Being leaf-sprung like the limousine, it gives car-comfort in the saddle.

On View at STAND 73

"COULSON"

for COMFORT on ANY road.

The days of the RIGID frame are numbered! The advent of perfect suspension over both wheels marks a new era in motor cycle construction. Leaf-springing over the rear wheel—which is the principle of the Coulson Patent—gives to the motor cycle the one thing which it has always lacked!—COMFORT.

Now that saddle pinion suspension—as distinct from the springing of the saddle itself—is possible, and is a proved success, the rigid frame must go. What motor cyclist will tolerate the vibrating bumpiness of the "rigid" frame when there is an alternative by which he can float over pot-holes as though they did not exist?

Come and see the Coulson at Stand 73. The Show will reveal to the world what only the exclusive coterie of Coulson riders now know, which is that the Coulson is the most comfortable mount in the world.

Before making your choice of a motor cycle for 1922, therefore, be sure you see the Coulson. Mount it, and feel for yourself the supreme comfort of the leaf-springing over the rear wheel. Then we have no doubt which make you will buy.

The 1922 Coulson is being made by A. W. Wall, Limited, of Tyseley, Birmingham—the motor cycle makers of longest experience. Its reliability is therefore beyond question.

THE REX MOTOR MANUFACTURING COMPANY, LIMITED, COVENTRY.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

A RUSTY FRAME.

? Would a frame which was allowed to get rusty be liable to be weakened thereby at the joints? I have seen no sign of it coming apart.—E.A.Y.

It is unlikely that the frame would be seriously weakened, unless the rusting process had gone on for some years. An ordinary amount of rust, such as can be removed by a few minutes' application of emery cloth, would have no deleterious effect on the strength of the frame.

FITTING A GEAR BOX.

? I have a 1913 $3\frac{1}{2}$ h.p. Rudge (clutch single-speed model) and sidecar which has given satisfaction in a fairly flat district, but, moving to N.E. Yorkshire, I find the hills too numerous for a single speed. Will you tell me the most suitable two or three-speed gear box to fit with least structural alterations?—W.H.M.

It is rather difficult to fit a bottom bracket to the Rudge frame in order to carry a countershaft gear box, but there should be no insuperable difficulty. A number of firms of repair specialists announce their readiness to undertake this class of work. There are no two-speed gears for heavy-weight machines, but there is a choice of three and four-speed heavy boxes all of which are suitable.

A QUESTION OF NEGLIGENT REASSEMBLING.

? I had the misfortune some time ago to break a piston, and had it renewed by an engineering company who, I now find, have omitted to fit the gudgeon pin springs, and, in consequence, the cylinder is very badly scored. Will you give me your advice on the subject, as I may add that I have witnesses to prove that the cylinder was unscored at the time of the repair?—L.H.F.W.

There certainly appears to have been negligence on the part of the mechanic who fitted the new piston and gudgeon pin without making any provision for the retention of the latter in place. In cases such as this, however, it is usually difficult to obtain any satisfaction, as cases of deficient or negligent workmanship are for the most part difficult to prove. If, however, you are able to produce witnesses to the effect that the cylinder was unscored before the work was undertaken, and can also prove that the gudgeon pin retaining springs were omitted, it might be worth while if you would consult a local solicitor.

OILING BY HAND-PUMP.

? I have just taken over a 1914 hub gear model Triumph fitted with Best and Lloyd semi-automatic drip feed pump. (1.) Is it advisable, by unscrewing the needle valve to the fullest extent, to use this in the same manner as the pumps fitted to the later models? (2.) Also what mileage per pumpful am I to expect?—E.C.H.

(1.) You can use the drip feed as an ordinary hand pump in the manner you suggest if you so desire. (2.) One pumpful every six or eight miles at 20 m.p.h.

Important Dates.

Mon., Nov. 28th, to Sat., Dec. 3rd—
The Olympia Motor Cycle Show.

Sat., Dec. 3rd, to Tues., Dec. 13th
Brussels Show.

Mon., Dec. 26th, Tues., Dec. 27th—
M.C.C. London-Exeter London Trial.

Sat., Dec. 31st—N.W. London M.C.C.
Twelve Hours Open Winter Trial.

Fri., Jan. 27th, to Sat., Feb. 4th, 1922
Scottish Car and Motor Cycle Show.

Sun., Mar. 5th, 1922—Argenteuil Hill-
climb (France).

Mon., Mar. 6th, 1922—La Turbie Hill-
climb (Nice).

A BUILT-UP CRANKSHAFT.

? A $2\frac{1}{2}$ h.p. Villiers engine has been running quite satisfactorily until lately, when the two halves of the crankshaft that are held together by the crank pin came out of alignment. After truing up this happened again. I fitted a new crank pin and set of rollers, but with no success. The bearings are quite all right, except for a very little play in the gudgeon pin, which is not sufficient to cause any trouble. I recently had the flywheel shear its key, but this is on quite tightly now. How can I keep the camshaft in line?—W.A.

In all probability the crankshafts have been slightly strained when the crank pin came out of line, or it may be that the taper hole in the crank into which the pin fits is enlarged or not a good fit. By far the best plan would be to have returned the crankshaft complete to the makers for attention, as they may be able to regrind the engaging surfaces; if not, they will save you further trouble by advising you if repair is impossible and replacement is necessary.

FITTING A LARGER BELT.

? (1.) Would you kindly inform me as to the advisability or otherwise of fitting a $\frac{1}{2}$ in. rubber belt on a $2\frac{1}{2}$ h.p. two-stroke lightweight (two-speed countershaft gear), instead of a $\frac{3}{4}$ in. one; the pulley on the gear box and belt rim being intended for $\frac{3}{4}$ in. belt? (2.) Would it drive as efficiently as the correct size? (3.) Would it wear quicker than a $\frac{3}{4}$ in. belt? (4.) Would it be less liable to slip in wet weather than a $\frac{3}{4}$ in. belt? (5.) Any other advantages or disadvantages you can mention would be much appreciated.—A.T.H.

(1.) Provided the $\frac{1}{2}$ in. belt does not stand above the periphery of the pulley, there is no objection to its use. If it runs above the top of the pulley, however, it will probably wear very quickly, as the edges of the flanges may cut into the side. (2.) The drive would be quite as efficient. (3.) See No. 1 above. (4.) Liability to slip in wet weather would probably be slightly less. (5.) The $\frac{1}{2}$ in. belt is, of course, much stronger. You will appreciate, however, that the gear will be raised to some extent, and you must use your judgment as to whether the engine will pull a higher gear satisfactorily.

A BEGINNER'S QUESTIONS

? As a motor cyclist I am only six weeks old, and I have bought a 1914 $3\frac{1}{2}$ h.p. P. and M. sidecar outfit (in good order) offered by a friend simply because I could go no higher in price for a more modern machine. What I should like to ask is: (1.) Is the P. and M. out of date? (2.) If not, how is it that one is seldom seen on the road? (3.) Have you any records of P. and M. machines entering any of the many tests, etc., which are continually taking place?—E.J.G.

(1.) P. and M. machines are amongst the best known makes; the manufacturers have been in the industry since 1903, and their machine was probably the earliest two-speed chain-driven machine on the market. (2.) There are great numbers of these machines on the road, and we cannot understand how it is that you see them so seldom. (3.) They have been consistent performers in all the big reliability trials, and took the solo team prize in four pre-war A.C.U. Six Days Trials, while as reported at the time a new four-speed model with sidecar gained the 600 c.c. class team prize in this year's Six Days Trials.

BANGING IN EXHAUST PIPE.

Q. After fitting a long copper exhaust pipe to my $3\frac{1}{2}$ h.p. Rudge-Multi, I notice that tremendous explosions occur in it when running slowly. I might add that I have a 42 jet in my Senspray carburetter, and that both valves shut correctly, and the springs were renewed about a month ago.—A.E.H.

The trouble is due in all probability to the mixture being too rich, thus causing misfiring. The explosions, of course, are caused by the remnants of the last unexploded charge being ignited in the exhaust pipe by the hot gases from the following explosion.

GIVING AUDIBLE WARNING.

Q. Is it an offence not to blow the horn when turning corners at less than four miles an hour in country districts where there is scarcely anyone or any traffic about?—W.H.P.

The law is not very clear on the point which you raise; every machine must carry suitable apparatus for giving audible warning of approach, and there is an obligation on the driver to give this warning under all circumstances where it is reasonable to expect there will be other traffic on the road. The answer to this question depends entirely upon the particular circumstances involved.

SPEED ASPIRATIONS.

Q. (1.) I understand that standard and overlap cams are interchangeable on the Rudge engine. In the case of the standard machine (1921 T.T. Rudge-Multi), is any noticeable advantage in speed obtained by substituting an overlap cam (timing spark accordingly), and making no other alteration? Would this show, say, 5 m.p.h. extra, or more? (2.) Is it necessary to raise the compression ratio with a dome piston in order to obtain an appreciable increase in speed with the overlap cam? Will this show, say, 10 m.p.h. increase? (3.) The Rudge-Multi in question, standard cam and flat top piston, will do 53 m.p.h. by Bonniksen. Is this considered good? (4.) Is it possible to tune a standard Rudge engine to anything approaching 70 m.p.h. with standard carburetter, but using high compression piston and overlap cam, etc.? (5.) Am I right in believing this to be a slow revving engine? (6.) Are Scott 500 c.c. Squirrels capable of speeds of 60-65 m.p.h.?—G.B.P.

(1.) The overlap cam might reasonably be expected to increase the speed by about 5 m.p.h. (2.) This is rather a matter for experiment, and it is very doubtful whether 10 m.p.h. would be gained by increasing the compression alone. (3.) 53 m.p.h. (actual) is by no means poor for a standard machine. (4.) It is very doubtful if 70 m.p.h. can be obtained unless you have special tuning facilities, although it might be done over comparatively short distances. If this speed was attained by special tuning it is doubtful whether it could be maintained for any length of time, if the machine was used for ordinary road work. (5.) Under ordinary conditions the engine pulls exceptionally well at slow speeds. This is a necessary

feature with the type of gear used. (6.) From 55 to 65 m.p.h. ordinarily, although speeds in excess of 75 m.p.h. have been reached on Brooklands by C. P. Wood.

U.H. MAGNETO ADJUSTMENTS.

Q. (1.) Please instruct me how and when to lubricate the U.H. magneto on my two-stroke. It has no external oil holes. (2.) It is stated to be "most important" to place "a keeper of iron across the pole shoes before withdrawing the armature." In the U.H. this appears impossible, as a piece of iron cannot be inserted until after the armature is removed. Further, it does not appear to have pole shoes as ordinarily illustrated. (3.) Is grease packing necessary anywhere in addition to that on ball bearings? (4.) The Villiers engine is lubricated by petrol—10 ounces in one gallon of petrol. This appears sufficient when averaging 80 m.p.g., but should not more oil be added if one gets 90 to 100 m.p.g., for then the engine is doing more work? (5.) How are platinum points adjusted on a U.H.?—J.S.A.

(1.) This magneto does not require any other lubrication and the packing of the bearings with vaseline about every 10,000 miles. (2.) You should be able to arrange some form of "keeper" across the poles of the magnet, especially if you remove both end plates. There is no need to insert it in the armature tunnel. All that you need do is to ensure that the poles of the magnets are bridged by a piece of iron before the armature is completely withdrawn. If the magneto was held in the bare jaws of a vice it would answer. (3.) See No. 1 above. (4.) Within limits there is no need to increase the proportion of oil. If, however, the engine appears to require more lubrication, add a little. (5.) The points are adjusted by screwing in the centre screw of the contact breaker.

READERS' REPLIES.

MENDING A TANK.

In your issue of October 27th a query from "L.R.O." asked how to mend a leakage in the top of the petrol tank of a B.S.A. machine. May I be permitted to suggest an easier way out of the difficulty than resoldering, and one which at the same time should prove satisfactory? A little over two years ago I had a similar trouble with my 4 h.p. Triumph, the leakage taking place all round the collar. I cleaned the surfaces round it and applied a good coat of seccotine, which I allowed to stand for twenty-four hours or more to set hard. This I painted over with two coats of paint of similar colour to the tank. The paint protects the seccotine from atmospheric influence, and in my own case has now stood for two years without showing any signs of leakage. This is much simpler and less dangerous than soldering.—P. RADFORD.

ACCUMULATORS SPILLING ACID.

In reply to "G.L.G.'s" query as to any method of preventing acid spilling from his accumulator, I should very strongly recommend him to try packing his cell with glass wool, obtainable from any electrical accessory shop at a cost of a few pence. He will then find that by filling the accumulator with acid

before charging he can empty it again when fully charged with no detrimental effect to the accumulator, as the glass wool absorbs part of the acid. He should, however, be careful not to pack the glass wool too tightly, as he may buckle the plates of his cell. I might add that I have packed several cells in this way, with very satisfactory results. It is in no way an expensive method, as the acid can be used over again; it is not at all necessary to throw it away after once using, as is done by some people.—J.G.C.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"L.S.L." (Brondesbury).—Zenith-Bradshaw and A.B.C.: Speed, reliability, and consumption.

"V.F.C." (Liverpool).—Watsonian featherweight sidecar attached to $3\frac{1}{2}$ h.p. fixed gear machine: Stability when empty and reliability of three-point attachment.

"A.H." (Eccles).—Best type of accumulator (about 6 volts) for solo machine and head and tail lights.

"S.B.S." (Durham).—4 h.p. electrically-equipped Indian Scout: Reliability, speed, and power.

"J.B.H." (Harrogate).— $3\frac{1}{2}$ h.p. o.h.v. Douglas and A.B.C.: Durability, reliability, climbing, and petrol and oil consumption.

"M.C." (Harrow).—1921 $3\frac{1}{2}$ h.p. Sports Sunbeam: Speed, tappet noise, and acceleration.

"A.C.L." (New Malden).—Millford Junior, Hughes torpedo, Canoelet, or Watsonian sidecar on $3\frac{1}{2}$ h.p. Rudge Multi: Average speed, climbing, consumption, and acceleration.

"A.A." (Leven).—4 $\frac{1}{2}$ h.p. 1920-21 Quadrant outfit or similar big single: Reliability, pulling power, speed, consumption, and comfort.

"R.F." (Winchester).—4 h.p. Coulson-B: Speed, weight, tax, consumption, climbing efficiency, lateral rigidity of springing, effect on belt wear, and legality of silencing system.

RECOMMENDED ROUTES.

REIGATE TO BRACKLEY.—K.O.I.

Reigate, Burgh Heath, Ewell, Kingstons, Staines, Windsor, Eton, Slough (edge of), Farnham Royal, Beaconsfield, Amersham, Great Missenden, Wendover, Stoke Mandeville, Aylesbury, Whitchurch, Winslow, Padbury, Buckingham, Westbury, Brackley.

BRACKNELL TO LUPPITT.—R.J.W.

Bracknell, Wokingham, Reading, Theale, Woolhampton, Kennetholme, Thatcham, Newbury, Speen, Eddington, Hungerford, Froxfield, Marlborough, Fyfield, Beckhampton, Devizes, Seend, Trowbridge, Southwick, Beckington, Frome, Nunney, Shepton Mallet, Wells, Priddy, Cheddar, Wells, Glastonbury, Piper's Inn, Greinton, Otherby, Durston, Taunton, Wilton, Blagdon, Widcombe, Seanthorpe, Luppitt. Approximately 162 miles.

AGENTS MAY COME AND AGENTS MAY GO BUT

Having been with you since the pastime of motor cycling commenced, we are carrying on, knowing full well we shall be accorded that measure of support which is the fruit only of clean, honest, and straightforward business. Our greatest pleasure lies in supplying a recommended client, because it is, to us, the echo of an absolutely satisfied one.

Our business methods and our clients' appreciation have lifted us to the sublime position of one of Britain's Leading Motor Cycle Agents. Whatever your requirements may be, we shall be happy to receive them. No matter where you live, you will receive the same courtesy and attention. If you are purchasing a new or second-hand machine, we can, and will, advise you on request. Perhaps you can pay us a visit—if so, you are cordially invited to come and inspect our large and varied stock.

OLYMPIA.

Our representatives are in attendance all the week.

The BRAMPTON Bi-Flex SPRING FORK

Have you noticed the large number of successful Motor Cycles in all speed and reliability trials, that are fitted with the **BRAMPTON BI-FLEX**? Here are a few reasons why—

THE exclusive double action principle on which the "BRAMPTON" Bi-Flex Spring Fork is designed facilitates an independent and simultaneous movement of the front wheel in the direction of the lines of force produced by horizontal and vertical shocks, whilst the successful combination and arrangement of the springs, acting in compression, respond to the slightest vibratory movement or the irregularities of the worst road surfaces with masterly effectiveness.

Another feature which has contributed to make The "BRAMPTON" Bi-Flex Spring Fork famous, and so universally popular with riders, is the simplicity and efficiency of the patent adjusting arrangement of the links and rocker bars, by means of which lateral instability is entirely eliminated.

Descriptive Booklet illustrating models for Motor Cycles from 2½ h.p. upwards, free on request. See our Exhibit at the Cycle and Motor Cycle Show. **STAND No. 191, GALLERY.**

THE MOTOR CYCLE Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

Dear Sirs,

I take this opportunity of thanking you for your prompt and ungrudging settlement of this claim, and shall be pleased to recommend your Company to some of my friends whose experiences have been very different.

Yours faithfully,

**The only Safe Test
of Insurance is
Claims. We settle
Claims promptly.**

REPAIRERS.

WE can bring your machine up to date and make it into a countershaft model by fitting a new back, with Sturmey-Archer gear box; any machine converted.—A. Pilkington and Co., 390, Lichfield Rd., Birmingham. [7257]

CYLINDER Grinding and new pistons at cut prices. We specialise in high-class work and quick deliveries for all classes of engines. Discounts to traders.—Kellett and Collinson, Ltd., Havelock Works, Great Horton, Bradford. [8629]

CYLINDERS Reground, accurate finish, compression guaranteed: Triumph, Rover, Premier, etc., 37/-; all 2 1/2 h.p. single, 35/-; twins, 2 1/2 h.p. Douglas, 55/-; J.A.P., India, 35/-; 60/-; complete with pistons and rings.

PISTONS.—Every pattern, standard or oversize, in stock; low price.

PISTON Rings, high grade; none better; thousands of testimonials; oversize or step cut 2/-, standard 1/6 each; return post.—Patent Rings, 30, Wigan Rd., Atherton. [5191]

V.S. Motor Cycle Agency.—Supplying spares and overhauling V.S. 2-speed gears, which are also fitted to Matchless machines, etc. New and second-hand V.S. 2-speed gears in stock.—Geiger, 24, Mansfield Rd., Gospel Oak, London, N.W.3. [1037]

HUB Gear Machines Converted to Countershaft, or complete conversion sets supplied to suit all makes; recommended by the leading motor cycle manufacturers.—Sheldon Engineering Co., Bayley Lane, Coventry. Phone: 634. [2679]

WELDING, Welding, Welding.—Welding done by experts; cylinders, crank cases, gear boxes, pistons, cranks, flanges, etc.; aluminium a speciality. No cure no pay, and all work returned in 6 days.—H. Heap, 105, Bissell St., Birmingham. [0023]

BEACH Engineering Co., 42, Earl St., Coventry.—Engines rebushed, cylinders reground, aluminium or C.I. pistons fitted from £2; connecting rods rebushed; valves 5/-, guides 3/6; pistons complete from 26/-; rings 2/-; valve caps 4/6; other repairs quoted for. [0593]

CENTRAL Garage.—Have your Douglas made like new. We will completely overhaul, stove-enamel and replat parts; 2 1/2 h.p. £10, 4 h.p. £14; all replacements at cheapest prices. Other machines quoted for per return.—302, London Rd., Thornton Heath, S.E. [1047]

FRAME and Chassis Repair Specialists. Cut-downs, new forks, back stays, chain stays; fixed and hub gear machines converted; tube bending and machinery of every description; obsolete parts made to order; urgent jobs returned in 12 hours.—The Enfield Engineering Co., 31, Silver St., Enfield. [8049]

GODFREY'S, Ltd., 208, Gt. Portland St., London. W.1, specialists in motor cycle repairs of all descriptions. Completely equipped workshops at 14, Miller St., Camden Town, N.W. (Phone Museum 2434), which afford exceptional facilities for overhauls and repairs at moderate prices. Estimates given. [0639]

ACETYLENE and Electric Welding.—Broken flanges, cracked water jackets, scored bores, worn bearings built up; aluminium gear boxes, crank cases, any broken motor part welded and machined up and returned in 7 days; 14 years' experience.—Lincoln Jeffries, Jun., Gun and Motor Maker, 120, Steelhouse Lane, Birmingham. Phone: Central 729. [2818]

WHITE and Watson, Motor Cycle Repair Specialists.—Douglas riders now in our opportunity 2 1/2 and 4 h.p. Douglas cylinders reground and fitted with two new pistons complete, and valves refaced for £2 and £3 per pair; other cylinders at the following rates: Up to 65 mm. 25/6, 70 mm. 29/-, 80 mm. 34/-, 85 mm. 37/-, and over 39/6; 2-strokes extra; aluminium pistons; engines rebushed, rebalanced, and overhauled; gear boxes overhauled and replacements machined.—White and Watson, 80, Belvedere Rd., S.E.1. [9860]

WE specialise in repairs to N.S.U. engines and N.S.U. engine-shaft gears; our enormous stock of N.S.U. spare parts (having acquired the company's entire stock-in-trade and patterns) enable us to supply to suit practically all N.S.U. models, including the earlier types, fitted with Eisenmann L.T. mag., also for the 2 h.p. N.S.U. engines fitted to 1913-14 O.K. machines. In ordering, it is important to submit old parts as pattern; trade enquiries invited.—Eagles and Co., Acton Hill Works, Spares Dept., 275, High St., Acton, London. [0355]

IF only the best will satisfy you, then the Tennant Engineering Co., 238, Bristol St., Birmingham, alone can please you. Super-critical you may be, but their work will pass your inspection down to the last detail. No firm has more experience, no firm has keener workmen, no firm has greater or better facilities for turning out perfect work, and no firm will strive more to give you satisfaction. Cylinders rebored and fitted new pistons. Rebuilding of every description. Engines completely overhauled and returned full of vigour and vim. Frames altered and repaired. Everything fully guaranteed and at competitive prices. Official repairers to A.C.U. and R.A.C.—Phone: Mid. 1928. [0047]

CLUB ANNOUNCEMENTS.

Space can always be obtained under this heading for announcements required by Clubs. Rate, 3d. a word, minimum 3/-.

IF

YOU HAD COMMENCED TO RIDE MOTOR CYCLES 25 YEARS AGO, and at the end of that time found yourself capable of enjoying anything up to 80 m.p.h. on either Road or Track, I think that you would agree that you had little to learn concerning the why and wherefore of any known Motor Cycle, and what I want you to feel is that the experience I have gained during my 25 years on the road and track is at your disposal. I am able and shall be most happy to advise you impartially regarding any machine. It is true, that what is one man's meat is another man's poison, and if you will meet me at the

ENFIELD CO.'S STAND—No. 86 AT OLYMPIA, or write to me at our usual postal address, I shall be happy to try and prevent you from buying the wrong machine. Will you please consult me on the distinct understanding that apart from the fact that you are under no obligation to purchase from us, it will be a distinct pleasure to me to try and assist you.

The machines which we are offering for the 1922 season include:

**ARIEL,
B.S.A.,
DOUGLAS,
ENFIELD,
HUMBER,
INDIAN,
MATCHLESS.**

**NORTON
RUDGE,
SCOTT,
TRIUMPH, and
VELOCETTE
Motor Cycles.**

Also

**ROVER,
BELSIZE-BRADSHAW,** and **GROUCH
Light Cars.**

In addition, we have, as always, one of the largest stocks of bargain machines available in this country. We can arrange exchanges, or would be happy to supply on any reasonable system of deferred payments that is convenient for your good self, and I am hoping that I shall see you either at Olympia or that I may hear from you.

Yours enthusiastically,

J. W. TOLLADY, General Manager.

Dynamo Lighting is Easy if you fit "WATTALITE"

Being driven by flexible shafting direct from the wheel—like a speedometer—it gets rid of the complications and difficulties in fitting that have hitherto made Dynamo Lighting impossible on many machines. This is only one of "Wattalite's" many advantages. We are Sole Sales Concessionaires, and will be glad to tell you all about it.

SIDECAR SPRINGS.

REAL SPRINGS

12/6 each.

Made from the B.E. spring steel.
SIDECAR CO., 25, Upper Clapton Road, E.5.
'Phone Dalston 8110.

**PROUD SELF-CLEANING,
VARIABLE JET,
& EASY STARTER.**

THE SIZE OF JET IS VARIED WHILE RIDING by moving lever "D," allowing you to obtain best possible results from your engine at all times, and reduce your Petrol Bill.

EASY STARTING is assured by pressing knob "C" smartly, which raises Plunger "B" forcing a spray of fuel through Jet. "A" at high pressure, causing instant vaporisation. **CHOKED JET** is cleared in the same manner while riding.

For AMAC, B & B, SENSAPRAY and ZENITH 8/4. Post free by return.

Handle-bar Control 11/6 extra. When ordering state make and year of Carbu- retter and length of Jet and Holder, or better still send id Jet and Holder as pattern.

BELT-ARIEL-GRIP STOPS-SLIP

GIVING INCREASED LIFE AND POWER TO YOUR DRIVING BELT

Your tool-kit is not complete without a stick! Guaranteed non-injurious, and free from resin gum, glue, pitch, tar, wax, grit, or anything objectionable.

"Ariel" Belt Grip feeds and preserves the belt against the destructive effects of slipping, wear, friction heat. Imparts grip, and renders slip practically impossible under wet weather and other conditions.

NEW South African Field Boots, leather lined, double toe-caps, gusset for winter wear; carriage paid, 21/-, worth double; approval with pleasure.—Bridle, Manufacturer, Hove. [9445]
CALENDARS—Smart line of monthly tear-off, printed with your name, trade blocks, etc.; 50 £1/1, 100 £1/12/6, 250 £3/3. Samples free.—Cheverton and Laidler, Dept. A.E., Dunstable. [9804]
PRINTING—Billheads 5/6 1,000. Cards, memos, duplicate books, postcards, handbills, envelopes, etc. Splendid value. Samples free.—H and E Jones, 2, Edgbaston St., Birmingham. [4386]
AIR Service.—Surplus gauntlet gloves, all leather, hands lined wool, very soft and warm, gauntlets leather lined, the ideal for driving and cycle, etc., brand new; 7/6 a pair.—H. Emanuel and Co., Tyre Factors, 37, Balls Pond Rd., Dalston, N.1. Phone: Dalston 3161. [0739]
NEW Double Geared Breast Drilling Machines with 3-jaw chuck, £1; new 6in. self-centring lathe chucks, 6 jaws, £3/10; 1/2 horizontal gas-electric engine, dynamo, 20 volt 5 amp., £8/19/6.—Butler, Littleover, Derby. [X2490]
MOTORISTS—R.A.F. pilots' leather gauntlets, with fleece-lined mitt, for sale, price 21/- only, post free, splendid value; actual value 52/- per pair; 15,000 sold last year; only 450 pairs left.—Hobday and Sons, F.A.I., Government Auctioneers, 20, Bucklebury, E.C.4. [8814]
CYCLE and Motor Transfers.—Complete set of lines for pedal cycle frame, including mudguards, pannelled, single and double lines; one colour 1/6, two colours 2/-; many varieties. Motor lines, hand transfers, B.D.C. quality, made only by B.D.C.; list 2d. stamp.—Axon, Station Buildings, Atrincham. [X2301]
ARMY and Navy Surplus Goods. Approval terms.
 New naval overalls, 6/11; army boots, 15/11; black and brown field boots, 25/-; naval oilskin suits, 10/6; new Sou'-Westers, 1/-; ground waterproof capes, 4/11; new gents' and ladies' lightweight oilskins, a bargain, 12/11; army shirts, 12/- pair; post extra. Send for free list.—M.C., Lethbridge's, 75, George St., Devonport, Devon. [7923]
TRANSFER Lining.—Complete set for pedal bicycles in gold, red, green, 1/6, or double colours 2/-; also for motor cycle tanks, sidecars, etc., in various widths and colourings. Registration letters, numbers, new hackney carriage lettering in white; prices on application; stamp.—The British Transfer Printing Co., Ltd. (proprietors Liffie and Sons Ltd.), Quinton Works, Coventry. London: 20, Tudor St., E.C.4. Manchester: 199, Deansgate. [0114]
SAVE Money.—Just at the time when everybody is anxious to economise, your postage bill has doubled itself. Allow King's to help you to keep down your postage expenses by drawing on their stock of envelopes, size 5 1/2 x 3 1/2, at 3/11 per 1,000 (Reference No. 1001). Samples can be had free of charge and post free, and all orders can be despatched per return.—Write at once to J. C. King, Ltd., 42-60, Goswell Rd., London, E.C.1. [2484]
GIVEN Away.—Motor cyclist's stormproof suit (black pegamoid) given free to every purchaser of lined flying cap (ex-R.N.A.S.), made of black leather, lined chamamois and Nutria fur, price 25/-; motor cyclist's blocked leggings (black leather), 10/6; cleaning gloves, reaching to elbow, 1/-; fawn waterproof cap cover, with neck-piece, 1/-; all goods new and perfect; carriage paid.—Street, Cove, Hants. [9464]

MISCELLANEOUS.

TIME Sheets for immediate use, supplied from stock, 1/- per 100; 8/6 for 1,000. Copyright forms ruled and printed for daily, weekly, and foremen's time sheets; also workmen's time sheets and pay sheets, showing where employed on outdoor work, travelling, and other expenses, variations of work forms; materials, sheets, contractor's record of carting. Specimens free of all charge and post free.—J. C. King, Ltd., 42, Goswell Rd., London, E.C. [2483]

MOTOR Suits, reduced half the usual price, double-breasted jackets, seatless trousers, superior quality, 42/-, also sold separately. Government surplus, all new; suits all in one, lace at back, with helmet, 25/-; oilskin jackets, full lined, 16/-; trousers, lined, 11/6; rubber trousers, 14/6; long rubber Poncho capes, 18/-; cap covers, 1/-; all carriage paid and approval. We are unequalled for value.—Hawthorn, Ltd., Dept. M., Shrewsbury. Established 34 years. [0110]

AEROPLANE Parts.—Undercarriage, consisting of 2 disc wheels, 5ft. Palmer cord covers and tubes, size 700x100, and axle fitted sliding collars, 35/-; wheels (aeroplane), less tyres and tubes, sizes 600x85 and 650x65, 2/6; propellers, 2 blade, polished mahogany 5/-, covered fabric 3/-; switch boxes (6 switch), new, 7/6; switches, Thomson-Bennett 3-way, brass, 2/6; ball races, new, in 6 sizes, 3/-; petrol taps, new, with 2 nipples and unions, 1/3; Bowden stops, new, with adjusting socket or screw stud, 4d.; needle valves, brass, new, 1/-; petrol cocks, 3-way, complete with 3 nipples and unions, 2/6; petrol valves, diaphragm type, 1/-; filters, petrol or oil, 6d.; petrol only, for cars, brass casing, 1/-; breathers, brass casing, 1/-; rubber joints, 1/4in. to 1 1/4in., 1d.; clips, 1d.; oilers, complete with 7/16 copper tube, nipple and union, 9d.; magnets, C.A.V., self-starters, new and complete, 35/-; wire, low tension, 8ft. 4d.; carburettors, Zenith twin 7/6. Clandel-Hobson (new) 10/- (for cars and lorries only); triple electric cable, insulated, 2d. ft.; shock absorber, new, 1/4in., 3d. ft.; armoured electric cable, new, in lengths 6ft., 6in., 12ft., 15ft., 2/9, 6/-, and 7/6; special offer of bushes, blades, 2d. each, 11ft. doz., 15/- gross; files, 1/- each; sparking plugs, English or American thread, 1/3 each; Conlon-B tanks, as fitted, enamelled, less fittings, 5/-; spot lamps, complete with globe and wire, 1/9; inner tubes, new, W.D. size, 895x135, 5/-.

ALL the above plus carriage. Quotation and list on application. Stamp, please. Satisfaction guaranteed or money refunded.—Hutton, Red Lion Hill, East Finchley, London, N.2. [9713]

NOTICES.

1921. O. No. 1262.

IN THE HIGH COURT OF JUSTICE. CHANCERY DIVISION.—MR. JUSTICE RUSSELL.

IN THE MATTER OF THE PATENT AND DESIGNS ACT, 1919. AND

IN THE MATTER OF LETTERS PATENT No. 819 OF 1906. AND

IN THE MATTER OF AN APPLICATION BY EDITH AUGUSTA OSBORNE (Married Woman), and SAMUEL NIELD.

NOTICE IS HEREBY GIVEN that the above named Applicant, Edith Augusta Osborne (Married Woman), of "Rostrevor," Grimes Hill, Birmingham, and Samuel Nield, of "The Mascot," King's Norton, Worcester, the registered Proprietors of the above named Letters Patent, have by Originating Summons dated the 8th day of July, 1921, applied for an Order that the term of the said Letters Patent may be extended for 5 years or for such period as the Court shall think fit.

AND NOTICE is hereby given that on Tuesday, the 17th day of January, 1922, application will be made to the Court that a day may be fixed before which the said Summons shall not be in the paper for hearing.

AND NOTICE is hereby given that any person desirous of being heard in opposition to the said Summons shall at least 7 days before the said 17th day of January, 1922, lodge notice of such opposition at the Chambers of the Judge, Room 175, Royal Courts of Justice, Strand, London, and serve a copy thereof upon the Applicants.

Dated this 18th day of November, 1921.

BARLOW, BARLOW & LYDE,

165, FENCHURCH STREET, LONDON, E.C.3.

Agents for James Ore of Birmingham. Solicitor for the above named Applicants, on whom all documents requiring service may be served.

"Volex"

DRY BATTERY, MOTOR CYCLE and SIDECAR Lighting Outfits

Recommended for Home and Export.

"Volex" Dry Battery Lighting Sets are the ideal no-trouble outfit. No other battery outfit will give results equal to the "Volex".

In satisfactory service for over 10 years with a constantly increasing demand due to their reliability, convenience, and economy in use.

These sets give from 9 to 12 months service, in ordinary intermittent use, without renewal of batteries.

Specification—6 volt "Volex" Dry Batteries in metal container, Switch-board, Superba Head Lamp (5 1/2 in. front), Side and Tail Lamps, Cord and Bulbs.

BRITISH MADE.

No. Mc/490, as illustrated. Also supplied with "Superba de Luxe" Head Lamp, 7 in. front. No. Mc/450.

Price £8-8-0
Price £9-9-0

Ready for Immediate Use.

"Volex" Motor Cycle Solo Lighting Sets. BRITISH MADE.

The most efficient Dry Battery Solo Sets produced. Made upon the same principle as our "Volex" Combination Set. Head Lamp is provided with 6 volt bulb, giving an exceptionally brilliant light and ample light is provided in the rear lamp.

"Superba" Head and Rear Set.
5 1/2" front Head Lamp, M10/10 .. £4 12 6
Head Lamp set only, M10/7 .. £4 2 0
"Superba de Luxe" Head and Rear Set.
7" front Head Lamp, M10/11 .. £5 7 6
Head Lamp set only, M10/8 .. £4 17 6
"Superba" Head Lamp, 5 1/2" front.
Complete with Holder and Adaptor .. £2 0 0
"Superba de Luxe" Head Lamp, 7" front.
Complete with Holder and Adaptor .. £2 12 6

THE "RAY-O-NITE" SELF-CONTAINED MOTOR CYCLE ELECTRIC HEAD LAMP, Recommended for Home & Export. A GREAT "VOLEX" ACHIEVEMENT.

No accumulator, oil, or acid required; a brilliant light obtained at will. The convenience of this self-contained set cannot be over-estimated, the pleasure of having a lamp always ready for use without preparation will be appreciated. A successful self-contained motor cycle lamp such as the "Ray-o-nite" is only rendered possible by the remarkable efficiency of the "Volex" Dry Battery, which is in a class apart from all other primary batteries. Comprising "Superba" Head Lamp (5 1/2 in. front), combined with a strong metal container holding the "Ray-o-nite" Dry Battery, complete with bulb. Ready for immediate use.

No. M9/1 .. £3 10 0
Ditto, with "Superba de Luxe" Head Lamp (7 in. front) .. £4 4 0
"Ray-o-nite" Dry Batteries 10/6 Can be fitted in a few seconds

Quarterly Licences.

QUARTERLY licences for motor cycles will be made optional for 1922. In making this concession the authorities have acted wisely, although not without some pressure on the part of such bodies as the Auto-Cycle Union and the British Cycle and Motor Cycle Manufacturers' Union. Since the introduction of the new taxation scheme at the commencement of this year, car owners have been allowed to take out short-period licences, and there was never any justifiable reason why motor cyclists should be debarred from such privileges. Elsewhere in this issue we give full details of the 1922 scheme.

In the case of lightweight the quarterly tax is 10s., representing 33⅓% increase on the year's taxation; the same rate obtains in the case of the motor cycle over 200 lb. in weight, the tax for which is £3, and the quarterly licences £1 each. During the present year car owners have had the same privilege for a total extra charge of 20%.

From this it will be seen that the quarterly licences are not to be regarded as an "easy payment," for 33⅓% considerably exceeds the extra charge made for a motor cycle sold on what is known as the "hire purchase system."

From the point of view of the purchaser of a motor cycle, there is no gainsaying that quarterly licences will be a great boon, and also assist materially in keeping the flow of motor cycle sales more uniform all the year round. At the same time it seems strange that the authorities evidently do not give to motor cyclists advantages proportionate to those obtained by car owners. 1922 motor cycle quarterly licences, compared with those for 1921 in the case of cars, are scarcely fair to those who use the smaller vehicle; yet, for the coming year, car owners are to have additional advantages which are not to be accorded to motor cyclists. From January 1st the cost of car taxes will drop in the case of yearly licences with the progress of the year, and with the quarterly licences with the progress

of the three months. For example, the yearly tax after February is only 90% of the total, and so on to December, when the tax is but 10%; yet, if a motor cyclist wishes to purchase a machine in December, he will be compelled to pay a full quarter's licence. Quarterly licences are arranged on a similar basis. In other words, one may take out a car licence at any time of the year without having to pay at an excessive rate for the privilege.

Show Results.

ASATISFACTORY Show in every respect! Such was the unanimous verdict of exhibitors at Olympia at the conclusion of the Show last Saturday.

The splendid attendance and interest on the part of the public augurs well for the motor cycle movement in 1922. Some manufacturers confessed to us that they went to Olympia without expectations of a large number of orders accruing; but the feeling at the conclusion of the Show was one of optimism.

It is now being realised that the time is gone when a year's output may be disposed of at the Show. When demand so exceeded supply, motor cyclists placed their orders in November to ensure delivery in the spring, but now purchasers feel that this is unnecessary. As this is a new state of affairs, agents are unable to gauge their requirements, and so long as they are reasonably sure of obtaining delivery of motor cycles when required, they follow the lead of the private purchaser and order only sufficient to retain the agencies considered to be the most valuable. One would therefore expect to hear expressions of satisfaction only from the older and well-established manufacturers, but the younger firms have also intimated that they are well satisfied with the results of their week at Olympia.

The good effects of this year's Show cannot be measured in orders received. The Olympia Show is excellent propaganda, for it creates and fosters interest in the most economical form of motoring

Getting Back Towards Normal.

OLYMPIA showed more substantial price reductions than most amateurs had anticipated.

Of course, if we haven't sold our 1921 mounts, these reductions do us as much immediate harm as good, for they enhance the already heavy depreciation on the 1921 models. Nevertheless, everybody must welcome the cuts heartily, for they betoken a return to normal conditions, and will save us in 1922 depreciations all they may cost us in selling the 1921 'bus. When you can get a $4\frac{1}{2}$ h.p. three-speeded chain-driven sidecar outfit for £105 (the Quadrant), the air has almost recovered its 1914 tang.

Some Doughty Newcomers.

IT doesn't require much acumen to guess that 1922 is going to welcome some formidable additions to the competition world. To name at random a few engines which even on a Show stand impressed the observer as likely medal winners, the Powell ought to do well in road events. The Barr and Stroud may prove hot-stuff on road and track alike. The new 350 c.c. Raleigh will have to be reckoned with, not to speak of the new $2\frac{3}{4}$ h.p. Bradshaw. Meanwhile the Triumph has annexed the hour record, and, as I write these notes, I hear that a couple of 500 c.c. twins both intend to rob the holder at the first opportunity.

Many Opinions.

I DESCRIBED some while ago how I was testing a punctureproof tube by perforating it whilst inflated and out of the cover. The vendor of a conventional tube wrote to me privately that, though the tube might be excellent, yet my test was ridiculous, as high pressure could not be obtained when the tube was out of the cover. He failed to recognise that in this particular case the inflation pressure is a vital factor in the sealing action. The plastic material which is interposed between the two layers of the double tread of the tube certainly possesses an expansive action of its own; but I should say that air pressure unquestionably assists the sealing. At any rate, if I stick a big nail in the naked tube, a tuffet

of black mastic is quite forcibly ejected into the hole as the nail is withdrawn; if this occurs when the tube is mildly inflated in the open, inflation pressure behind the mastic must be much more marked when the tube is blown up to riding pressure inside a cover. So I beg to reply that my test was quite unusually hard on the tube, and actually more severe than the prolonged road tests to which I had previously submitted it.

Electric Lighting.

ACETYLENE lighting will enjoy a new lease of life owing to the excessively high cost of electrical equipment. For £3 or £4 a decent gas installation can be procured. A flywheel lighting set for baby two-strokes costs about £5 extra. Accumulator or dry battery installations range from £4 10s. to £7, the latter being suitable only for slowish machines. Full dynamo equipment is usually—in round figures—very nearly a £20 option. A Fallolite set costs £7 7s. 6d. without a tail lamp. A number of fast solo men are buying accumulator outfits, but the average rider is economically minded and contents himself with a gas installation—possibly flanked with a dry battery tail lamp.

Testing Their Wits.

THE other day I took the parcel section of my morning post into a clubroom where motor cyclists were assembled, because it is rather fun to baffle a keen rider at his hobby, and I fancied two of the gadgets which has just arrived as samples might be too much for the boys. No. 1 resembled a miniature aluminium model of the tin hat which so many millions found such uncomfortable wear a few years back. It measured $1\frac{7}{8}$ in. across, and nobody could make head or tail of it, or of the two microscopic holes which pierced its bowl. (Solution: An anti-splash vent for petrol filler caps.) No. 2 was really dead easy, but nobody quite tumbled to it. It was obviously an extra air valve, complete with Bowden control. Everybody recognised this; some of the examinees further identified a petrol pipe union and a needle valve as indicating an auxiliary pilot

Occasional Comments.—

jet for starting up. But two insulated electric terminals beat the crowd, though the obvious inference was a hot wire for vaporising the paraffin-cum-water which sometimes masquerades as petrol in these degenerate days. No. 3 was the Jebon patent automatic lubricator. Not a soul had the faintest inkling what possible use this device could be to a motor cyclist; and when an illustrated account appears in *The Motor Cycle*, readers will probably excuse the failure. I have now made it a rule to diagnose all gadgets before reading the covering letter; and I am fast developing into a mechanical Sherlock Holmes in consequence.

Garrulous Old Fogey.

AT the risk of earning the above cognomen, I must really reminisce a bit more. The M.C.C. used to open its season (which was then the season, for the M.C.C. dominated the sport) with a run to Brighton. Little birds twittered that two firms intended to stagger humanity by producing entirely novel passenger outfits. On the great day, Van Hooydonk appeared at Purley, trying not to look too conscious; he bestrode a Phoenix Trim with two-speed gear and handle starting. He demonstrated *ad nauseam* until the late Wilbur Gunn rolled up on a 4½ h.p. Lagonda tricar with open frame and quite put the Phoenix nose out of joint. He started this now forgotten contraption by tipping open a trapdoor in the waist of the chassis, and executing a few steps of the Washington Post on a pedal and chain gear. At Crawley, some mean-spirited person pinched Hooydonk's starting-handle. We all felt that pedalling starters were sound design after we had heard Hooydonk discuss the situation fluently for five minutes.

Those Trailers.

SEVERAL veteran readers have written confirming my jesting reminiscences about the perilous trailer which we all used before Percy Kemp invented the sidecar and J. Van Hooydonk begot the Phoenix Trim. An Earlsdon (Coventry) reader once arrived home minus his wife. He retraced his tracks, and found he had decanted her at the corner of Green Lane, some 1½ mile away. She had made a pancake landing on her face, and the trailer was incontinently sold. Another reader much enjoyed his first ride on a trailer, but forgot its presence when

negotiating the narrow gate at the side of his villa. He says the trailer uprooted the gate posts; but with my vivid memories of the virile engines then current, I am prepared to bet that the engine immediately stopped, and that no damage was really done. Mr. Victor Holroyd, of Rudge fame, confesses to having taken out a trailer containing his daughter, and having shortly become oblivious of the appendage. He cut corners, dodged under horses' tummies, and performed such stunts as a young rider will. When he got home, the youngster remarked, "Mamma, father *can* drive!"

You have all heard of a "flat spot" in the mixture. Well, there is still a flat spot on the back of my head; and anybody who has ever been seated in a fast trailer when the connection snapped will testify that no physical event can possibly be more instantaneous than the resultant "biff" on the rear of the skull; there is no time to swear.

More About Depreciation.

ON November 10th, I devoted a paragraph or two to the influence which excessive depreciation is having upon the sales of motor cycles. I pointed out that, despite such depreciations, it was the plain duty of patriotic riders possessed of spare cash to place their orders. Several correspondents have raised a fresh aspect of the case. They are able and eager to obtain delivery of 1922 models, but they want to obtain a "fair" price for the 1921 'bus first. A sale by private treaty seems almost impossible, and dealers are fighting very shy of exchange deals, or at the best offering about 50% of what the 1921 'bus originally cost. This enables me to make my point more clear. I have just parted with one of my 1921 'buses. It was originally a thoroughly good machine. It is, if anything, in rather better order than when it was delivered. Its price at the beginning of 1921 was just about double what I have received for it. It is conceivable that if I had waited till the spring brings

some fine weather along, I might have got a better price for it: November is always a bad selling month, because 75% of us do not ride in the winter. Nevertheless, I consider that immediate sale was both a patriotic and a paying proposition. If we all wait till Easter to buy, we shall have to subsidise a lot of unemployment. It is probably cheaper to sacrifice a few pounds on selling our second-hand machines now than to pay extra rates and taxes. One comparatively small town adopted a £200,000 relief scheme last week.

THE DUKE OF YORK AT OLYMPIA. A snapshot of his Royal Highness departing from Addison Road entrance after inspecting the exhibits last week.

NOT since pre-war days has the Olympia Motor Cycle Show revealed such definite progress along clearly defined lines. During the past two years there has been a steady struggle for high efficiency at a moderate price, and, in spite of unfavourable trade conditions, the results are becoming apparent.

1922 is to be a year of 350 c.c. singles. There is scarcely a firm catering for the solo rider who did not show at least one model with this type of engine, while many give alternatives of sporting, touring, and even sidecar types.

This is a step in the right direction, for it is a proof that the efficiency of small engines has been increased until the power output is sufficient to meet the demands of all normal work. Indeed, some of the sports models are capable of over a mile a minute—a speed which is seldom attained on the road even by sporting riders—while the tourist who has no desire for sheer speed will find that the modern “350” will take him anywhere, will need no more attention than the 500 c.c. of a year or two ago, and will be altogether lighter and handier.

Much of this improvement has been brought about by attention to cylinder cooling, which has enabled higher compression ratios and more scientific valve gear to be used without overheating. Additionally, lightweight three-speed gears have made their appearance in quantity, and this has gone far to help the smaller machine.

Undoubtedly the 350 c.c. machine has come to stay, and, in course of time, will only be ousted from pride of place by the development of the 250 c.c. engine—a type which is fast coming to the fore. All this must not be taken to mean that the big single and big twin are dropping out of their own particular spheres. In fact, the industry has never been better represented in these lines than at the present moment.

The Big Twin Speed Mount.

In the larger classes, development has taken place along similar lines, and our friends from across the

herring pond may have to look to their Brooklands laurels in the course of the next few months. Speed is not everything, but high efficiency in reason means better road performance with lower petrol consumption and better balance, and it is a fact that the latest high-efficiency large twins are smoother, quieter, and more tractable than ever before.

In an intermediate class, the big single has received further valuable support from the trade; new additions to the type bear well-known names and testify to the efforts which have been made to produce a low-priced utility machine capable of hard wear and long life in the hands of the public.

In the smaller classes, the V twin is steadily giving place to the flat twin, though the former holds its own in the 1,000 c.c. class. 6 h.p. Douglas and Coventry Victor are challengers in the mediumweight class, the former having earned a wonderful reputation in a remarkably short time, while the latter has given satisfaction in the hands of the public and greatly distinguished itself in the 500 Miles Race.

The V-twin Bradshaw oil-cooled engine is unconventional in appearance, because the cylinder barrels are enclosed in the crank case.

New Engines.

There are several new proprietary engines of note, in addition to new models listed by well-known manufacturers. A range of Bradshaw oil-cooled engines is distinguished by high efficiency and absence of mechanical noise—features which have in the past been considered separately rather than together. The careful investigator could gather from the sectioned flat twin on the Zenith stand many hints as to how this valuable combination has been obtained. First, it is obvious that the concealed cylinder barrel will be devoid of audible “ring,” while the plain bearings, copiously flooded with oil, will obviate rattles and knocks. The reason for absence of noise in the overhead valve gear is also not far to seek, for the section reveals a very massive cylinder head, which, in addition to deadening valve chatter, evens the head temperature, and thus materially improves cooling.

Comparatively speaking, a newcomer, the B. and H. twin is interesting in many respects. The head

Lessons of the Show—

Detachable cylinder head of the C.A.M. engine. Internally "hexagonal" valve caps and a generously ribbed exhaust port are features.

neto platform. Again, the pressure lubrication system of this engine is both ingenious and foolproof.

Quite one of the sensations of the Show was the 350 c.c. Barr and Stroud sleeve valve engine. The

Partly sectioned model of the single sleeve valve Barr and Stroud engine, showing the general simplicity of, perhaps, the most interesting new engine at the Show.

is detachable about the level of the valve chest, and thus valve caps are obviated, and the whole head can be adequately cooled. In addition, the bevel-driven magneto may be placed in front or behind by merely reversing the combined timing cover ring and mag-

operation of the single sleeve is the last word in simplicity; the engine is beautifully finished and is wonderfully silent and flexible in action; added to this it is a highly efficient job, capable of high speed and low fuel and oil consumption. At the moment, it is fitted to a Beardmore-Precision model only, but it may be prophesied with safety that it will become a serious competitor of the

more normal type of engine during 1922.

A new two-stroke under the famous name of White and Poppe has made its appearance. As might be expected, it is a remarkably fine piece of work, having an overhung crank supported on two widely-spaced roller bearings. An aluminium piston, with plenty of metal in the head, is employed, deep and tapering fins surround the cylinder, and there is an unusual form of choke tube in the transfer port. This engine has recently undergone a strenuous bench test of long duration with flying colours, and is likely to make a name for itself in the lightweight world during the forthcoming year.

A double row roller bearing and long lubrication slots in the big end are features of the C.A.M. engine.

It is impossible to mention each of the new models which were displayed in various makes of machines. J.A.P. and M.A.G.-Blackburne predominate, and the overhead valve 350 c.c. model of the latter make is to be found on several

sporting machines, but the C.A.M. engine fitted to the Rex-Acme is notable for its detachable head with well-cooled exhaust port. The Young aluminium cylinder with cast iron liner is interesting, and the

One of the most popular engines for sports models is the 2 1/2 h.p. overhead valve Blackburne. The valves are inclined.

To prevent back-firing into the crankcase, this ingeniously shaped gauze is held in the transfer port of the Stanger by the detachable cover-plate.

Big and little ends of the Humber connecting rod are well drilled and grooved to ensure an ample flood of lubricant in the bearings.

Economic flat twin two-stroke shows a simple way of getting over the ignition difficulty of this type by the use of a flywheel magneto.

Some mention has already been made of cooling, but the ample ribs on Bradbury, Abingdon, and New Hudson singles are worthy of note. The new big single Abingdon is purely intended for heavy sidecar work, and the bearing areas are very generous.

Bearings and Lubrication.

These two subjects should undoubtedly be considered together, yet a curious discrepancy occurs in motor cycle design at this point. The Bradshaw engine, it is true, employs plain bearings and forced lubrication, yet the majority of firms who have adopted

Detachable valve seatings have long given satisfaction on the flat-twin Humber. As illustrated, this allows easy access to the valve itself, and valve caps are eliminated.

Lessons of the Show—

Handle-bar operated oil pump and drip feed on the Brough Superior.

tendency towards the laudable ideal of relieving the rider of responsibility, and lubrication systems by pump or other mechanical method, such as the utilisation of crank case pressure, are on the increase. The Hawker two-stroke is an admirable example of the latter type, while the Velocette and Bradshaw engines may be taken as typical of mechanical feed and forced lubrication systems. There is not much change as regards the number of engines using plain or ball and roller bearings; if anything, the numbers are in favour of the ball bearing, but the New Hudson big single is a new acquisition to the former type. It should be mentioned at this stage that at least four leading

mechanical lubrication use roller or ball bearings at any rate on the main shaft; while those who fit plain bearings throughout still rely on hand pump and drip-feed oil supply. There is, however, a steady

has made great strides in popularity, for, in addition to forming a serviceable shock-absorber, it does not require frequent adjustments. Full chain protection shows no great signs of advancement; in fact, the majority of manufacturers appear to consider that it is preferable to leave the chains accessible for adjustment rather than to protect them from the need of such frequent adjustment. Diamond and Verus are, however, good examples of completely protected chains, though in neither case are the chains intended to be run in oil baths. Sunbeam, Triumph, B.S.A., and Lea-Francis are already well-known for their chain protective methods and need no further comment.

Part sectional diagram of the Scott Sociable three-speed-constant mesh gear box; it is contained in the crank case extension, and driven by a double helical gear.

Transversely set engine, gear-unit and shaft transmission of the 2 1/2 h.p. F.N. (de luxe model).

makers have come to the conclusion that mechanical lubrication is a necessity, two of them having experimental models already on the road, while two more are redesigning their power units with this object in view. Lubrication by hand-applied air pressure is to be found on several two-stroke machines.

Transmission.

Chain drive has scored heavily all along the line, but especially in the lighter classes. Belts are retained (usually as an option) for those who still prefer this form of transmission, or in order to keep prices down; but the general adoption of shock-absorbers somewhere in the system has rendered chain drives almost, if not quite, as sweet as chain and belt.

Shock-absorbers show a tendency to move forwards to the engine-shaft, and this is now the most usual position, though the Enfield type of cush hub is remarkably popular. Formerly almost exclusively used by the Rover, the Brampton spring link chain

The F.N. and Unibus remain the sole examples of shaft drive at the present stage of development, and, in spite of the success achieved by this type, there are no signs that the lead is likely to be followed in the near future. The only instance of combined chain and belt drive with the elements in their theoretically correct positions is to be found on the Kenilworth miniature, where the high-speed drive is by belt and the secondary drive by chain.

Engine and Gear Units.

For some years past, almost every new American and Continental motor cycle has embodied an engine and gear unit, and the Indian Chief is another new edition.

This year, however, there is a distinct move in this direction on the part of British manufacturers. The 8 h.p. Bradshaw, 4 1/4 h.p. Beardmore-Precision, and J.E.S. are perhaps the best examples, since, in these cases, the gears are actually housed in extensions of the crank case, but, in the case of the 5 h.p. Lea-Francis, the lighter New Imperials, open frame Omega, two-stroke Metro-Tyler, Dot, Reynolds reg-

A single plate clutch of extremely simple design on the Kenilworth miniature.

Lessons of the Show—

Distinctive features of all Diamond models are the detachable tank rail and the duplex detachable down tubes.

about, and a few others, the engine and gear box are carried on the same bearer plates, and can be detached as a unit. This latter scheme does not provide the full advantages of the unit system, but it is a step in the right direction, and is almost certain to lead to further development.

There are strong rumours of a real engine and gear box unit with common lubrication system from one of the most important firms in the trade, while another is already on the road, but for the present, at any rate, will not be marketed.

Frames.

On the whole, not very much visible change has taken place in frame design. The sloping top tube is even more common, and in certain cases lighter tubes of special steel are being used. The Hagg employs steel pressings wherever possible, the Omega shows a very neat design and strong duplex frame containing the engine unit and footboards within its width, the Ner-a-car with its car type frame is an interesting novelty, and the Peters frame has a minimum of tube work.

The last-mentioned machine was perhaps one of the most interesting in the Show; with the exception of its wheels, it has hardly a point in common with the average motor cycle, yet all its novelties appear to be practical as well as ingenious. Concealed spring forks and spring rear frame, a triangulated mainframe composed of a steel tank, one tube, and the engine, a clever system of automatic lubrication, and a very simple expanding pulley gear with belt tensioning device combined are some of its features, while a combined bottom bracket and silencer, large head races, pressed steel guards and carrier, and flywheel lighting and ignition all add to the charms of the machine.

There is a slight increase in the number of duplex frames, but perhaps the most noticeable feature is the frequent use of steel lugs. Beardmore-Precision frames employ sheet steel lugs throughout, and a proprietary frame unit to be seen on several stands has a like distinction. Head lugs are frequently machined from forgings, and the B.S.A. incorporates several fine forgings, particularly the lug joining the chain stays and the bottom bracket tubes.

Loop frames are on the increase, and one of the most striking examples is to be found on the New Imperial light models. The Indian Chief is yet another addition, though this might also be described as a duplex frame.

Springing.

With the exception of the Dot, Peters, McKechnie, and Hagg systems, there is little new as regards spring frames, but spring saddle suspensions are increasing in numbers; Indian, Douglas, Calthorpe, and New Imperial are to be added to the lists, and new models of the Brooks and Tan-Sad have made their appearance. Reynolds Run-about and Jupp have spring bucket seats, and the Terry and Jelley flexible top saddles should not be forgotten. Perhaps the most novel is the McKechnie Coventry Victor system, and, though this type is undoubtedly an advance in many respects, it is likely to be handicapped by the public's undoubted aversion for the unorthodox. This would be a pity, for the design is most striking, and, in the course of time, should lead to developments along new lines.

Genuine Lightweights.

There is a genuine revival of the true lightweight motor cycles. Grigg, Economic, McKenzie, and J.E.S. are excellent instances of the case in point; J.E.S. is particularly interesting, in that it incorporates a two-speed gear in its tiny crank case, a system of pressure lubrication to every bearing, and, in the four-stroke model, an atmospheric valve.

This last feature may be looked upon with suspicion by some riders, but, as it is a very modern product, and has been adopted after considerable experience with the mechanical valve, it must not be confused with the early and troublesome a.i.v. of olden days. The possibilities of the return of the automatic inlet valve are just now much discussed.

In numbers pedal cycle attachments and scooters are level runners; all have points of interest, and should find a market amongst cyclists who would be glad of motor assistance, but wish to retain, as far as is possible, the lightness and handiness of their favourite mount.

Two tension springs only are used on the spring fork of the Chater-Lea lightweight.

What corresponds to the bottom bracket on an ordinary machine is used as the silencer on the Peters lightweight. Behind and below the saddle are the rear spring housing and a capacious tool box.

Lessons of the Show.—

Quick adjustment and parallel movement of the brake pad provided by simple means on the $2\frac{3}{4}$ h.p. Francis-Barnett.

Sports Models.

A feature of the Show was the number of so-called sports models. These varied from the standard machines stripped of their fittings so as to be sold at a lower figure to the most expensive and up-to-date production carrying a speed guarantee and embodying all kinds of refinements with superb finish. One of the most businesslike examples in the Show was exhibited on the Sunbeam stand, but the A.J.S., Triumph, and Brough Superior are hard to beat in this class. Massey-Arran and Sheffield-Henderson also show very racy little machines, and the Scott Squirrel is no mean performer; the list could be extended indefinitely, but the New Imperial, Francis-Barnett, and Edmund should be mentioned as typical of the better sports lightweights.

Mudguarding and Detail Work.

A very real improvement has taken place as regards protection; the car type of wide flat guard is becoming general, and the inclusion of legshields in the standard specification is by no means uncommon. Except in the case of sports models, it was hard to find a badly guarded machine, though some of the very light machines ran things rather close in their efforts to reduce weight and price.

Finish was, on the whole, good, but the practical rider who rides hard and often will deplore the amount of plating still to be found on some machines. Still, there are people who like it, and they have plenty of opportunities for gratifying

Fitted with a kick-starter and fairly extensive mudguarding, this $2\frac{3}{4}$ h.p. A.J.S. is a step between the stripped sports and the touring models.

their tastes in the selection of a resplendent and glittering mount.

Fork stops, rubber handle grips, convenient change-speed levers, handle-bar or foot-operated oil pumps, improved tank fixings, concealed wires, stouter rims, spokes, transmission shock-absorbers, waterproof hubs, grease lubricators, and a hundred and one small but important items were to be found, and it is safe to say that greater strides have been made in detail work for 1922 than in any Show since the war.

Two-stroke.

Though it is impossible to mention *all* the lessons of the Show in a few pages, these notes cannot be closed without some reference to one of the most popular types of engine—the two-stroke. There are several newcomers, but little change in general design. There is but one 500 c.c. single, the Dunelt, but a new Connaught has been introduced with an engine of 370 c.c., and the Peters and Omega are new to the 350 c.c. class. It has fallen to the lot of the two-stroke to develop the lightweight sidecar outfit, and further improvements have been made in this direction, but the public are apt to forget that a two-stroke won the 350 c.c. class in the 500 miles race at Brooklands, and that a speed of over 70 m.p.h. has been accomplished on a two-stroke of no more than 250 c.c.

In popularity the two-stroke has grown apace, and though no very obvious developments have taken place during the past year, its problems are being studied, and some of the best brains in the country are employed in solving them.

The J.E.S. four-stroke, a fine example of the true lightweight.

A refinement worthy of note on the New Imperial is the adjustment provided for wear on the brake, and also the position relative to the toe.

1922 PRICES.

Next Year's Motor Cycles classified according to their Prices.

PRICE is a topic of interest to all motor cyclists at the present time, and in order to convey conveniently the exceptional value now offered by manufacturers, we give below a list of 1922 motor cycles classified according to their price. With most makers cataloguing a large number of models it has been impossible to include them all, hence it has been necessary to take as examples a type common to the majority. In the case of lightweights under 350 c.c., the prices shown include two-speed gears with clutch and kick-starter unless otherwise indicated, while the prices

of larger machines are for three-speed models. In considering these prices, it should be remembered that the majority of manufacturers of lightweights also offer single gear and plain two-speed models at prices below those in the schedule, while three-speed models are available in almost every range.

In the case of sidecars, the various standard outfits have been quoted, but these may in some models be more fully equipped than others; the Douglas range, for example, is all equipped with lamps, etc., and the Reading-Standard price includes dynamo lighting.

FROM THE PASSENGER'S POINT OF VIEW.

Modern Sidecar Coachwork
as Revealed at Olympia.

A sporting streamline aluminium sidecar for attachment to the Scott Squirrel.

Martinsyde "torpedo" sidecar in aluminium.

SPORTS models, both in sidecars and machines are to be the vogue; there seemed no end to the numbers and varieties at Olympia last week. Some of the smart little streamline bodies exerted quite a spell over people who could not possibly have found use for them. Portly dames, who could only have squeezed into the bodies with difficulty, were highly amused, if not fascinated by them, and seemed loth to pass them by in order to consider the purchase of a more staid looking affair. They are so *chic*, and in some mysterious way one associates them with French heels, silk hose, and dainty ankles. No wonder the speedman's 'bus in these days is no longer a single-purpose machine, as it used to be, for one of these featherweights can be attached with ease without harming even a highly tuned machine. Whether the limousine coupé or corpulent taxi sidecar survives or not, these lithe and sporting sidecars will live as long as the sports model motor bicycle lives. The heavy coach body of a few years ago could not possibly have

An extremely neat touring "Rideezi" sidecar body fitted with concealed auxiliary seat at the rear.

One of the many examples of sidecars with dickey seat.

been used with a high gear ratio, but these rakish bodies can be, for they are exceedingly light, and offer only the minimum of wind resistance.

Who could help but admire the Scott Squirrel outfit, for instance, with its dirigible pattern sidecar, quite one of the most *pétite* in the Show, a delightful thing in polished aluminium, with a baby Avro windscreen complete. The guarantee, too, of 60 m.p.h. for the machine, solo, makes the outfit still more attractive.

Another sidecar in the same category as the Scott was the Toronda, attached to a Brough Superior. This model, finished in hand-beaten mottled aluminium, was complete with a hood which folded away in the locker behind; the supports were of steel and also folded into a receptacle beneath hinged armrests. No untidy flapping hood and rattling supports when out for a speed burst!

For fine finish and gracefulness in design, the Canoëlet range was not easily surpassed. There, fashion appeared to have dictated as it does in other

A graceful but exceptionally light Hughes model made for the 3 h.p. Beardmore.

DETAIL IMPROVEMENTS.

The Auster combined sidecar windshield and cover fitted with "Lightning" running fastener.

From the Passenger's Point of View.—

spheres, and it was obvious that the high-backed model which many riders still prefer is to go the way that fashion intends short skirts to go. The high back has been sacrificed to obtain graceful lines, and the contour of every Canoelet model was really graceful. Incidentally, Messrs. Mead and Deakin have adopted entirely different springing systems to suit particular models, and not simply modified a heavy pattern for lightweight work. Of the Canoelet bodies, perhaps the semi-sporting Model A4 was the most attractive, the little railed deck or luggage carrier adding in no small degree to its pleasing lines.

Predominating Primrose.

And what delicious colours the coach painters have mixed this year; the very names are intriguing—primrose, lime, dove grey, electric blue, ruby, yellow, lavender, moss green, and so on. Yellow, perhaps, should be reclassified into primrose, sulphur, lemon aureolin, gamboge—in fact, the whole gamut was used, giving sparkle to the stands. But why so much yellow?

A sidecar that took many people's fancy was the Cruiser model on Hughes and Sons' stand. The dash with its screen, though, of course, not new, is very graceful, and a good-sized locker was provided. There is nothing parsimonious about the upholstery.

Another model on this stand of interest to he who is termed "the family man" was designed to carry an adult and two small passengers; yet it was not in the slightest degree cumbersome.

A sidecar of original conception, also of interest to the family man, was the Sandum dual-purpose sidecar. By removing the seat (spring back complete) to a more forward position—and this is quite easily effected—then opening the back locker lid, where a further spring back and spring seat are concealed, this body, though of normal size, is converted into a sidecar big enough for two adults. An attractive proposition.

An ingenious device on the Matchless double-seater which allows the door to open from either jamb, giving access to either front or rear seat.

Evidently the Sandham Engineering Co. have had the question of passenger-carrying to heart, for, in addition to the model mentioned, they exhibited a side-by-side, or sociable, body that fits on to a standard-sized chassis. No doubt their experience gained in taxi sidecar body manufacture helped them considerably in evolving this useful model.

One could not help admiring the many attempts at accommodating more than one passenger in the sidecar without sacrificing unduly the general appearance of the outfit. Indeed, one of the strongest arguments in favour of the powerful sidecar outfit as against a four-wheeler at the same price is the very question of accommodation; and these sidecars in question are, therefore, the more commendable. *Apropos* of the side-by-side-seated sidecar, the success of the taxi sidecar should dispose of the bogey that this form of seating imposes undue strain on the machine.

Contrasts were offered on the Willowbrook stand; their taxi would have accommodated Daniel Lambert, but their little sporting model was surely the minimum in weight, probably as light as any in the Show and admirable for sidecar speed events.

130 Guineas for the Sidecar Alone.

Another taxi sidecar that appeared to be the last word in finish and luxury was the O.E.C., offered at 130 guineas, the chassis of which is all steel and mounted on cantilever springs. On this stand of the Osborne Engineering Co. there were two other models that would appeal to the most fastidious critic in finish, suspension, and general design, the tandem model being specially attractive.

The Girdex chassis, already described, was exhibited on the Whitely Manufacturing Co.'s stand, and shown with sidecar lifted. To demonstrate the rigidity of the Girdex construction, onlookers were invited to stand

Locker fitted in the hinged "scuttle" of a P. and M. sidecar—an approved refinement in the automobile world.

Montgomery adjustable celluloid windscreen. The sketch shows the method of detaching it for access to the seat.

An original and useful device on a Martins sidecar—a folding shield. The windscreen is probably more ornamental than useful.

From the Passenger's Point of View.—

on the extreme corner and observe the infinitesimal movement caused by its weight.

Chassis construction of well-thought-out design is used on the Dunhill sidecars, the tubular members being in the form of a triangle. This important part of a sidecar did not interest the ladies as did the Limousette in peacock blue; which was beautifully finished in grey leather and complete with V screen—indeed a fine example of the sidecar maker's art.

Quite one of the neatest ideas in double-seaters was on the Beardmore-Precision stand. Whilst retaining quite a sporting appearance, the body provides tandem accommodation, a screen being fixed for each passenger.

In Public School Colours.

Grace and distinction characterised the Montgomery sidecars, the *modèle de luxe* being a particularly fine example of sidecar building. Quite an original and attractive idea in the painting of some of the Montgomery sporting models was the adoption of school or club colours.

The Millford-Rock chassisless sidecar was the attraction of the Mills-Fulford stand, and it can be said that this model is all that the makers claim for it in the way of comfort. It may be remembered that the usual

The Girdex chassis shown with the Whitley sidecar, lifted for practical demonstration of the rigidity of its construction.

chassis and tired wheel, but hung it on a spring balance for the "Thomas's" to test the weight for themselves—a good idea.

To what many uses has the bulbous back been put. On the Norton it drops down and forms a capital luggage grid; the back of the *de luxe* bulbous Rideezi may be utilised as a table for a roadside tea. On scores of sidecars the rear portion is used as a dickey seat—truly a godsend to sidecar makers is the bulbous back.

Detail Refinements.

Many were the various little contrivances which go to make sidecaring more luxurious. The P. and M. sidecar, for instance, had, below the dash, a well finished mahogany instrument board and a shelf for gloves and powder box—a sidecar incidentally of exceptionally attractive design, finished in a delicate colour and complete with a silver swallow

An original idea in hood manufacture. Made of aluminium in strips like a venetian blind, it folds neatly away when not in use as shown in the inset.

tubular frame is entirely dispensed with, and is replaced at the back and front with two spring-loaded steel members attached directly to the body. On this model the mudguarding arrangements were exceptionally good.

On the Grindlay sidecar, too, particular care has been bestowed on the springing; the firm's successful and well-tried system being retained on all except the sporting models. In connection with the latter sidecar the Grindlay lightweight screen was shown, and an ingenious little fitment it is, being exceptionally easy to adjust.

A Proved Lightweight.

Weights of machine, like their speeds, are often exaggerated. Sometimes the makers' weights are near the mark, but they are very, very seldom underestimated. The makers of the Watsonian featherweight—a model for racing men—did not simply offer their word that it weighed but 60 lb. complete with

mascot. On the Martinsyde sporting model the apron between the screen and passenger could be pulled up to the neck to form a shield. The Douglas adjustable screen that could be pulled forward or backward at will was quite a good feature—so accommodating.

The hood of the Toronda sidecar folds away in the rear locker.

From the Passenger's Point of View.—

The A.J.S. celluloid side screens, too, must have been the outcome of practical experience. It is so easy to design sidecars, screens, and hoods that look all right, but which in practice fail miserably.

The Passenger Knows.

For candid criticism of these things, commend me to the matron who has been married so long and side-carred so long as to be rid of all delusions. Here you will be told how ineffective is the flat screen, how badly sprung the body, how unanatomical (is there such a word?) the contour of the seat back, and what, in short, a beast your particular sidecar is. Bachelors, of course, know nothing of this — everything is "lovely" in the sight of their passengers. This deflection only points out, of course, that each year the sidecars must be increasing in comfort, especially with regard to screens, springing of the bodies, and upholstery, because makers (except those that ride in cars) are influenced by their wives' candid criticism, and also — incidentally — perhaps by their customers' opinions. That effective screens were badly needed is evinced by the solid popularity of the Easting, Cameo, and similar screens.

An Aluminium Folding Hood.

Hoods, one might think, cannot be very original in conception, but can't they? A designer of a hood shown on the Sidecar Body Co.'s stand outstripped every body in originality by evolving a pattern in aluminium which folded up as compactly as the ordinary type; on a polished aluminium sporting sidecar this should harmonise excellently.

The unconventional ideas in sidecars were good to see, and were just as welcome as those that were shown on the machines themselves. Occasionally one hears the scoffer when anything appears which does not conform to his channelled intelligence, but it was ever

thus for the breaker of new ground. Another designer that disdained the beaten track was the maker of the Berthon sidecar shown in the Annexe, a streamline pattern, built boat fashion, finished in the natural wood.

Theatre Cars.

She of the fur coat and French heels was catered for very thoroughly on the Harley-Davidson and F.N. stands. On both stands the entrance was in the centre, and it was amusing to note the direction of travel according to the sex. The ladies marched immediately to the right to examine the luxurious Harley limousine, to the left on the F.N. stand, to wonder at the exceedingly striking primrose coupé.

Could luxury go beyond this priceless Harley model (£275 with motor cycle thrown in)? On opening the door the electric light is switched on, there is an armrest, mirror (naturally), flower vase, V windscreen adjustable for ventilation, and the upholstery is sumptuous, Bedford cord, of course, in dove grey—a peaceful colour. Perhaps slightly less amazing is the F.N. coupé, not quite so lordly—more of the Parisian touch about it—but still really rather

remarkable. (It was illustrated last week.)

I did not examine the chassis and suchlike minor things that carried all the Harley sumptuousness, and I almost forgot to mention that in the ceiling of the sidecar there was an electric bulb set in a pale pink silk rose.

Variety.

In truth, a buyer not biassed towards any particular make must have had difficulty in choosing a model. The selection, ranging as it did from the racing Henderson to the Harley-Davidson limousine, was such as has never been seen before, and characterising very many makes was the superlative finish of the coachwork; that, and the grace of the sporting models being the greatest improvements over last year's exhibits.

FRIAR JOHN.

A Lady's View of the Olympia Show. Solo, Sidecar, or Pillion?

By MAB LOCKWOOD TATHAM.

SHALL I buy a new motor cycle? In company with many other ladies I asked myself that all-important question, and eventually journeyed through much fog to Olympia, where I found that there are machines for every purse.

Sidecar or Saddle?

In these emancipated days, there are many of our sex who are not satisfied to watch somebody else have all the fun of driving, from the sidecar or the pillion. On the other hand, one does not always want the responsibility of driving. It is much more difficult to take an intelligent interest in the scenery if the mixture is not behaving properly or the engine is missing on one cylinder.

I think most of us like a little of both—change is charming, and, if one invests in a sidecar, one can take turn about with one's chosen companion. If fatigue overcomes enthusiasm, one can always lie down in the modern sidecar and go to sleep.

Are Sidecars Becoming Too Luxurious?

The first point that strikes me is that the aim of nearly all the sidecar models is to be as much like a car as possible. Well, of course, comfort is always a desirable thing, but surely motor cycles have a sporting element which does not demand out and out luxury.

Probably the most striking exhibit of the luxurious class in the Show was the F.N. limousine, a wonderful lemon yellow car fitted to a 7 h.p. four-cylinder machine. It had seven windows, and the port light on the right opened for communication with the driver. The V front contained two opening windows, and the side windows pulled up and down on the railway carriage system. The upholstery was carried out in Bedford cord, and electric light and a mirror in the dashboard completed a charmingly luxurious interior. Whether we shall see many of these on the road is an open question. Personally I prefer the standard model at £135. The former would be just the thing in which to be taken to a theatre, but for ordinary touring I prefer something like the Harley-Davidson or Matchless open models. The position of the sidecar in both the latter is higher than on most of this year's types, which fact, while doing away with the popular sporting effect, makes conversation with the driver easier and reduces the risk of being splashed.

There seems to be a big effort to cater for whole families. There are tandem, double, convertible, limousine sidecars, and tandem motor cycles. The O.E.C. limousine attached to a 10 h.p. Blackburne is a striking example—it accommodates four people including the driver—and instead of handle-bars, the machine is fitted with a car steering wheel, while synchronised brakes act on the rear and sidecar wheels. The price of this is 242 guineas. Why not buy a car? [Where, madame, will you find a British four-seater car at 242 guineas?—ED.]

It occurs to me that, in spite of all the developments of the sidecar, there is still room for improvements in one or two points. Take windscreens, for instance. In many cases, particularly in sporting models, the screen is set so far forward as to be of very little use, and even then it is too small. Another point: why do manufacturers make sidecar doors so small? In some of the sidecars, the narrow doors make it really difficult to get in and out.

Independence.

I would really much rather drive a solo lightweight machine. There is more interest, it is less expensive, and it does not require so much garage room. In these days of the kick-starter and clutch, there is no difficulty about starting up. There is no necessity even to wear special costume if one objects to it, as there are many excellent open frames made. Personally, I prefer special costume as being warmer, neater, and safer than skirts, and a diamond frame because it gives a knee-grip and renders the engine more accessible.

The best-known open frame machine is the Scott, which, of course, is standard, but there are many lighter and lower priced machines which are equally suitable. The Velocette people have produced an open frame this year which is very low, has kick start and clutch, a patent silencer and a guard over the sparking plug. The lowest priced ladies' machines in the exhibition were the Mackenzie, J.E.S., and the Radco, all of which seemed practical and easily managed; there are a number of diamond frame machines which are perfectly suitable for our sex. They are nearly all low, engines are well enclosed, and legshields are the feature of most of the newer models. Also T.T. handle-bars are coming into their own for road work—not in an exaggerated form, of

MAKING UP THEIR MINDS. Olympia Sketches, by Helen McKie.

Through Feminine Goggles.—

course, but sufficiently so to give the horizontal line. It is surprising how much more comfortable this position is than an upright one for long distances. Amongst standard solo models which appeal to me most are the 2¾ h.p. Douglas, the 3 h.p. Omega (which has a central spring stand), 2¾ h.p. Alldays-Allon, Levis, 2¾ h.p. Massey-Arran (the facsimile of the machine on which Whalley did so well in the T.T.), and the 3½ h.p. Sunbeam, the last two being amongst the many motor cycles now available without a "flapper bracket."

Prices.

Judging from the attitude of people visiting the Show, there is general satisfaction over the decrease in prices. Of course, there are still very expensive models, but there are cheaper ones as well—some of them very cheap—I think the value is better than it was before the war. We are getting more improvements, more reliability, and better design for very little more than the machines cost us in 1914. Next year should be a very good one for motor cycling, now that this most attractive pastime is being brought within reach of the masses. The more motor cyclists there are, the better it is for all concerned.

People who go to the Exhibition.

All sorts of interesting folk were in evidence, the family man with mother and little Willie were looking for the ideal sidecar turn-out; Bill and his girl wondered whether they will have a flat or a motor cycle when they are married; the sporting girl with the critical eye on all the sports models; the little fluffy girl who was more interested in the exhibitors

WINTER
HEAD WEAR.

Miss Peggy Fraser, herself a motor cyclist, is the only fashion artist to consider the requirements of her sisters of the wheel. Some time ago Miss Fraser designed two motor cycling costumes, which were published in these pages, and now she submits three designs for hats in suede and glacé kid.

has a very short wheelbase!" And he is still wondering who the joke was on.

The exhibition undoubtedly was of much greater interest to ladies than in former years. They are being considered more and more by designers and manufacturers, both as passengers and drivers. And a very good thing, too. English girls have long been famous for their love of outdoor sport, and what can be healthier, cleaner, or more exciting than a good little engine, a broad highway, and lots of petrol?

Our foreign sisters, particularly in France, have yet to realise these joys, as proved by the exhibits at the Paris Salon, but they will probably follow our lead in time. And it is a lead. I hope this year to see more femininity on the road on two wheels than ever before.

HOW TO DIM A GAS LAMP.

MANY car drivers and not a few motor cyclists regard the dimming of head lamps as a courtesy which no gentleman can omit. Others consider the practice to be a direct incentive to murder or suicide. The first class may be interested to hear of two methods of dimming a motor cycle gas head lamp. One is to use the special Autoclipse lamp, listed for many years past by Brown Bros., which embodies a Bowden-controlled anti-dazzle disc. The other was invented by the son of a Teddington reader, and is shown in the accompanying sketch. It consists

simply of fitting an ordinary brass cock in the pipe line between generator and lamp. File a narrow groove in the plug of the cock, and continue to enlarge this groove until it feeds just enough gas with the cock shut to keep the burner alight. Mount a rubber gasbag between the cock and the generator, and close the cock whenever you wish to dim. I do not wish to damp the ardour of any inventive motor cyclist, but I don't quite see myself sparing a hand to close this cock when I am riding an 8-10 h.p. twin solo on grease, Ixion.

Illustrating the device described.

1922 LIGHTWEIGHTS.

A Review of Solo Machines from 110 to 400 c.c., from 75 to over 200 lb., and from £27 6s. to £105.

IT would be much easier to write about the lightweights that were not at Olympia than about those that were. In other words, it would be a far less involved task to comment upon the products of firms that do not make "lightweights" than those who do. Sixty-eight firms exhibited machines which are for catalogue and such purposes so classified; and many of these concerns showed four or five entirely different models; that is, with separate sizes or makes of engine and not calculating gear, transmission, or specification variations. (If there were more proprietary engines on the market, this figure could have easily been improved!)

Ceased to be a Type.

If such a referendum is a permissible criterion, as a solo machine the so-called lightweight is easily the most popular type. "Type," however, is not the most nearly correct word, since, with the advance of the lightweight, it ceased to be anything approaching a type. So much so, that there is now no safe definition of "lightweight." Mr. Webster would probably give it as the absence of the quality of being heavy. Ten years ago, the majority of motor cyclists would have very definitely stated that any motor cycle with an engine capacity of less than 350 c.c. earned the term—but, then, such a machine *was* of light weight, and, then, there were few, if any, engines between 350 and 490 c.c. Nowadays there are several 500 c.c. singles

that weigh considerably less than one or two or the more elaborate "three-fifties," and there are also some "overgrown babies" of 400 c.c. or thereabouts.

For the purpose of this article, therefore, the very generous limit of 400 c.c. has been decided upon. 90% of the class thus formed weigh less than the £1 10s. taxation limit of 200 lb., and the 10% that exceed it have generally excellent reasons (or compensations) for doing so.

Guaranteed 70 m.p.h. sporting machines, miniatures of 110 c.c. engine capacity, and every type between fall in this category, and one wonders if in the far distant future there will be a larger class of solo mounts in existence. Although the well-tried big singles and twins on exhibit retained the interest of an enthusiastic band of solo enthusiasts, there were few of the buying public who did not seriously consider, and many who chose, a smaller machine.

Speed an Important Factor.

This is not surprising, considering the amazing success of the "not exceeding 350 c.c." machines in 1921 competitions, and particularly speed events. Whatever may be said about the motor cycle becoming a purely utility vehicle, the average soloist still takes considerable interest in maximum speeds, and even if he attains 60 m.p.h. once only in his career, he gains considerable satisfaction from the fact that his machine was sold with a guarantee of that figure.

SPEEDY, ECONOMICAL, AND COMFORTABLE LIGHTWEIGHTS.

(1) Stripped speed model of the 2½ h.p. New Imperial. (2) An unusual combination—an o.h.v. Blackburne engine in a spring frame—the 2½ h.p. Sporting Coulson. (3) The lightest and cheapest twin-engined motor cycle in existence—the all-red Economic. (4) Frame springing on novel lines is incorporated in the 2½ h.p. Dot.

(1) Hinged rear stays working against coil springs is the principle of the spring frame on the $2\frac{1}{2}$ h.p. P.V. (2) Top tube, tank, saddle, and footrests are sprung on the $2\frac{1}{2}$ h.p. Edmund. (3) Ample shields hide a novel rear frame on the $2\frac{1}{2}$ h.p. Hagg. (4) Pleasing lines are followed by the "triangulated" Cotton. (5) Shaft-driven 3 h.p. F.N. (6) Novel throughout—the new Omega.

Lightweights have shown a bigger improvement in speed capabilities in recent years than either the 500 c.c. singles or the big twins. Nor is this confined to any one or two particular makes. Therefore, as the lightweight is, anyhow, comparatively light, the most prejudiced follower of the heavyweight cult thought twice before placing a repeat order last week.

Nearly Motor Cycles.

The Show was remarkable for the number of vehicles that are only motor cycles in the sense that they have two wheels and, usually, a motor cycle type of engine. The 110 c.c. Hack, the Grigg (50 c.c. larger), the o.h.v. $1\frac{1}{2}$ h.p. Kenilworth, and the unique shaft-driven Unibus, are simply more or less advanced developments of the seated scooter—the last-mentioned being very far advanced indeed. Higher up the scale, but still retaining such lingering suspicions of "scooterism" as (proportionately) diminutive wheels and open frames, come the Reynolds runabout, the Ner-a-car (nick-named on the spot the "Like-a-bike"), and the Jupp—three far from conventional attempts to give improved comfort and weather protection on two wheels. The imposing tandem-seated Reynolds is justified in exceeding the weight limits usual for a 349 c.c. engine, for it provides the same degree of comfort for each of its passengers. Just how it will behave on greasy tramlines arouses curiosity.

Before passing on to the undeniably motor cycle exhibits, mention must be made of the 75 lb. Mackenzie (not forgetting the copiously kilted sandwichmen in Hammersmith Road), the post-office-red flat twin Economic, the two remarkably attractive J.E.S. models, and the two-speed Grigg—genuine lightweights all, and bringing motoring for the million a step nearer realisation.

Almost in the same class may be placed the many single-gear or clutch model Villiers-engined lightweights, the majority embodying an ingenious pneumatic pressure lubrication system and extremely simple frame construction, and usually selling at £39 18s. Among the names on this type of machine are Spark, Monopole, New Courier, Dayton, Bownian, Mohawk, Wolf, and Victoria. Many other firms also use the Villiers power unit, but usually in a more elaborate layout.

Notable Two-stroke Models.

Two-stroke lightweights which do not embody proprietary units were shown under the following notable names: Omega (bristling with novelties—duplex frame and unit construction), Radco, Levis (211 c.c. and 247 c.c. models of greatly enhanced appearance), Velocette (three-speed touring and two-speed 50 m.p.h. sports models), Sun (with a rotary inlet valve in the crank case), New Hudson, Connaught (including a heavier 370 c.c. machine), James (for the first time with a conventional gear box), O.K. (two and three-speed, and a chain-driven machine), Chater-Lea, Ivy (two sizes, many models), Metro-Tyler (with concealed primary transmission, magneto, and gear box), Hawker, Allon, Beardmore (unaltered, but still original), Royal Enfield, Vindec, Junior Triumph, Hagg (well shielded), Calthorpe (full 350 c.c.), and Peters (regarding which the space at our disposal discourages a summary of its novelties).

1922 Lightweights.—

On the other hand, the four-stroke engine is just as popular, and was to be found in the chief lightweight models in an equally lengthy list of stands. Particularly capable little machines with 350 c.c. J.A.P. engines, lightweight three-speed gear boxes (usually), and all chain drive (often) were staged by the following:— P.V. (with simple spring frame), Diamond (with a completely enclosed drive in one case), Ready, New Imperial (loop frame and semi-unit construction, and a stripped sports model), Sirrah, Francis-Barnett (a particularly "clean" 60 m.p.h. sports model), Hobart (one of many), Rex-Acme (ditto), Dot (with a very novel spring frame), Coventry Eagle (with most handsome saddle tank, although the o.h.v. $2\frac{1}{2}$ h.p. model deserves equal mention), and Excelsior.

70 m.p.h. Claimed.

Many of the above specify the equivalent size of Blackburne engine, just as some of the following Blackburne models may also be supplied with J.A.P.'s: Coulson (with a proved spring frame), Sheffield-Henderson (the o.h.v. model—one of the Show sensations; said to be capable of 70 m.p.h., and looks it!), Massey-Arran (the same engine in a more conventional but very speedy and neat-looking frame), Cotton (triangulated frame design), Kenilworth (*début*), Hawker (resembling the two-stroke, and almost as simple), Verus, New Scale, and Edmund (a side valve sporting model with one of the neatest spring suspensions at Olympia).

The advent of several excellent lightweight three-speed gear boxes is responsible for a greater accession to the two foregoing classes of go-anywhere lightweights than is generally realised.

293 c.c. J.A.P. engines help to make several attractive lightweight *modèles de luxe*, including the Olympic, the Hazlewood, and the Silver Prince.

A Curious Fact.

It is a curious fact that the majority of the 350 c.c. or thereabouts four-stroke lightweights which do not use proprietary engines are made by firms who also market big six or eight horse-power sidecars. A.J.S., Raleigh, Douglas, Bradbury, Royal Ruby, and F.N. all come into this category. With the one size of engine, the A.J.S. was shown in varying degrees of nakedness, each with specific appeal; there are on the other hand two Raleighs, 343 c.c. and 399 c.c., and even on the sports model a kick-starter is retained. Very similar was the style of the Royal Ruby offering—349 c.c. and 375 c.c. engines—but a spring frame model was on view. Bradbury variations rest solely in transmission and gears. The flat-twin Douglas needs little comment; it popularised this size of engine. Shaft drive is not the only good feature of the new 369 c.c. F.N., but it is a quite distinctive point.

Although only the most interesting model on each stand has been briefly sketched in the course of this article, the variety of types thus exemplified is most striking. It must be admitted, however, that every class of lightweight has received attention; future developments will consist mainly of improvements dictated by experience. One or two may not survive to see another Show, but the vast majority are too good, whether distinctive or conventional, to die.

(1) A light, simple, but not unoriginal Excelsior. (2) Enclosed chain drive figures on the $2\frac{1}{2}$ h.p. Diamond. (3) Morris-engined Rex-Acme two-stroke. (4) The three-speed O.K., with final belt drive. (5) A popular two-stroke type—the $2\frac{1}{2}$ h.p. Spark. (6) A conventional Sun two-stroke, equipped with belt, guard, etc., as a ladies' mount; the valve is located in the crank case.

Some Casual Observations on the Olympia Show. By John Countryman.

AT home we subsist chiefly on beef and mutton. If a millionaire invites us to feed at the Ritz, we indulge in some weird and thrilling dish, which might or might not be the goods for everyday breakfast and dinner and tea. It is much the same with a motor show. All the year round we ride some 'bus which is emphatically conventional and substantial. At the

Show we content ourselves with a very brief inspection of our faithful servants, and wander round with gimlet eyes, peering about in search of what is novel or *outré*. Round these latter exhibits we congregate, and linger and argue. Some of them make good: some of them do not. Anyhow, these notes more or less faithfully portray a country cousin's round of the stands, and his half-admiring, half-cynical pauses in front of machines and

gadgets which were new to him.

John Countryman's Comments.

The surge which bore me past the turnstiles (he writes) began to ebb in front of the 70 m.p.h. Sheffield-Henderson—one of the machines adorned with a prop stand. Next door to it I noticed the swing suspension of the Olympic gear box, balanced by the Rudge eccentric front chain adjuster across the gangway—two pleasant alternatives to the still-too-common four-nut business. On the Edmund I principally noticed the Bowden lever for operating the oil pump at speed; a similar device adorns the Brough Superior, but in the latter case the big pump holds enough for thirty miles.

A. A. Scott was demonstrating the value of laminated gears on his Sociable; he drew a steel tool across a solid gear, and it rang: then across a laminated gear, which merely rustled. The 1922 Sociable has a neat spring drive. The McKechnie

spring frame is said to have been roughed out with a Meccano set; anyhow, it is immensely promising. The Velocette is obviously designed with deep sympathies for the owner-driver who has not wrestled with $\frac{3}{16}$ in. nuts jammed against the exhaust pipe, which they secure. The Velocette has pillar nuts which stand clear.

Three-wheeler Details.

Both giants and dwarfs duly appreciated the telescopic steering pillar on the T.B. three-wheeler. As a person who has sensitive ankles and yet relishes speed, I noted the jack fixed to the rear chassis of the New Hudson cycle car—a loose jack in the cockpit is a fearsome thing. Did anybody identify better looking mudguards than those on the Lea-Francis—car type, with a flattish dome?

The new Hawker is an interesting layout; the suspension of its saddle and lighting battery deserve attention. Price reductions are universal, but nothing has dropped so much as the Unibus—1921, £98 14s.; 1922, £49; it has handle starting, worm drive, and twin disc wheels which let the tyre drop off when they are separated.

One of the very few machines with locknuts on the drawbolts of the rear chain adjustment is the B.S.A.; its huge one-piece aluminium chain case is most imposing, and delightfully easy to clean. The Powell bristles with excellent points; the centrifugal crank pin lubrication looks like one of the best details in the Show. The little crannies on the crank case all have

rounded instead of rectangular corners, much facilitating the cleaning process. It has a capacious cast aluminium tool box in the proper place, *i.e.*, on the top of the tank. The main bearing housing is bronze-lined. I am credibly informed that the Powell and the Cotton are two of the few frames which steer and hold the road as nicely as a Scott.

Following popular American practice, the tank top of the Indian Chief acts as an "instrument board."

Legshields offering a minimum amount of wind resistance are fitted to the New Imperial light tourist.

Improved appearance is gained on the Quadrant by a saddle tank of circular section.

Items Which Interested Me.—

Somewhere hereabouts I started violently: there was the Kenilworth miniature, fitted with belt-cum-chain drive. *Not* chain-cum-belt; the belt was the primary unit, and ran over two tiny pulleys set very close together.

Mrs. Janson was busily talking Ner-a-car; it has the neatest kick-starter in the Show, and an excellent twist-grip control for the clutch. The new model Omega is full of sensible originalities, and is amazingly cheap. The power unit can be taken out very rapidly. The front forks can be adequately lubricated without annoyance. The handle-bar is made in two halves, and by exchanging the halves the owner can get a T.T. or upturned pattern at will. The tank fixing is novel, for the tank is pressed up against the top tube from beneath.

The Diamond is one of several machines which has its tool case pressed in one piece with the rear mudguard.

There is a great deal more in the new P. and M. than meets the eye. Though the engine is very little larger than its predecessor, it has nearly twice as much radiating fin area. The four-speed sidecar outfit weighs 20 lb. less than the 1921 two-speeded type. The sidecar dash and dickey are both excellent.—Many technical details repay study; for example, the shape of the fork blades, and the reason for the new shape. The record in all-weather 'buses was easily taken by the South Pole edition of the B.S.A., with aluminium legshields and a front screen reminiscent of an eighteen-pounder gun shield.

Two-seated Contrasts.

Passenger enthusiasts clustered continuously round the £150 model of the Morgan Runabout. No vital sacrifice seems to have been made to get its price down: a slightly shorter wheelbase, a one-piece body without side padding, but all the vital parts just as they are in the *de luxe* type. The aluminium Morgan with marine type ventilators was a great draw.

The Reynolds tandem, with its 72in. wheelbase, aroused memories of the old Ormonde and Phoenix days. It seemed quite impossible to get near the Zenith-Bradshaw, so I sought Bradshaw's private engine stand in the annexe. The crowd there was no smaller, but I was rewarded with the sight of his oil-cooled single-cylinder, a charming little unit, with an enormous rectangular sump.

In addition to the saddle springing on the new Calthorpe, the seat tube itself is supported by an enclosed spiral spring and oil dash pot.

Royal Enfield outfits are still "best sellers," as they deserve to be. On the little two-stroke of the same make one admired the mounting of the release valve on the *side* of the cylinder head, so that it need not be dismantled in order to clean the cylinder.

The two new Beardmores detained most visitors a very long while. Everybody had been aching to see the Barr and Stroud sleeve valve engine, which already enjoys a great gossip reputation; but really the 4½ h.p., with unit crank case-cum-gear box runs it quite hard in general interest. It has a nice mechanical oiler, which can be opened by a touch of the finger to feed a full charge in three seconds when necessary—this without the cost of retaining a separate hand pump. The sidecar outfit at £130 is one of the Show bargains; there is a large auxiliary silencer on the sidecar chassis with quickly detachable coupling, and the side wheel is sprung.

Excellent Value.

In a smaller class the Connaught sidecar at £95 was excellent value—370 c.c., three speeds, and all-chain drive. Nor was its specification scamped; as instances of refinement a three-way petrol tap and Showell mechanical oiling may be noted.

The Coventry Eagle is, of course, a *de luxe* machine throughout; but at least one of its features demands universal imitation. *Every nut is of the capped type*, a detail which vastly improves appearance, facilitates cleaning, and holds rust at bay. The new o.h.v. 6 h.p. Douglas is a welcome addition to the hot-stuff sidecar class—its mark seems to be about 80 m.p.h. solo and 60 m.p.h. with a sidecar. I liked the sensible toolbox and the patent leather undershield amongst its gadgets.

The sports Humber has one of the most powerful rear brakes in the Show—as befits a 70 m.p.h. machine. D.A. installations are not common yet, but one was neatly carried out on a Humber sidecar.

The Peters might have been designed by some engineer who had never seen a motor bicycle, for its designer departs from the conventional at every turn, using frame tubes as exhaust pipes, employing exhaust gas to work his oiling, running lighting wires inside his petrol tank, and so on. Visitors always recognise an original brain, and the stand was crowded.

The auxiliary drive for the dynamo on the Reading Standard is neatly encased

The petrol tank of the new Omega is held in position against the top frame tube—which lies in a longitudinal padded groove—by four jack screws, as shown.

Flexible petrol pipe connections between tank and carburettor on the Edmund spring frame machine.

Items Which Interested Me.—

The Economic machine was not the cheapest in the Show—I fancy I sighted one at twenty-six guineas; but it was unquestionably the cheapest twin, and the simplicity of its power unit is attractive—two castings bolted together compose the engine. The ash lathe chassis of the three-wheeled runabout revived memories of the 1901 Orient Buckboard.

All the knuts had congregated at the Brough stand, where interest was divided between that guarantee of 80 m.p.h., the 'buses which substantiate the guarantee, and a Toronda sidecar with a disappearing hood.

In the accessory stands mechanical oiling is much to the fore, witness the Showell, Lamplugh, and Best and Lloyd devices. The Hawthorn oil flow indicator (Rotherham) is probably easier to watch than a drip. Rotherham's solderless pipe coupling won the hearts of many amateur owners, who have bungled petrol pipe repairs. The Smith tank gauge made most of us pause. Enquiries for accumulator lighting sets were numerous, so were expressions of dismay at the prices. The Coventry rivet extractor is very neat, and can actually

be used without any handling of the chain. The Villiers flywheel magneto kept a set of lamps brilliantly lit up by the hour—evidently one firm, at least, has solved the problem of these dual outfits. The Imspecs air drive speedometer was sought out by

Showing the method of fixing the mud-guard stays to the outside of the hub spindle on the sidecar wheel of the Indian Chief.

many enthusiasts, some of whom had innocently fancied that it worked like a Pitot tube without any gearing; actually, its shaft runs at the same speed as the road wheel. I bought a pair of College pocket slippers for touring, all the Terry spanners (mine get stolen by wise knaves annually), and two Linco spanner sets, previously unknown to me. The Speedwell oil drum has won the firm many clients. Dinner time arrived just as I reached the Runbaken stand, where an aluminium piston with phosphor bronze wearing surfaces, a two-spark plug, and a spark tester were holding a small

crowd in rapt attention. Altogether, I do not remember a Show which sent one home with so many gadgets to talk about. Provincial clubs ought to organise loan collections of the more portable items. A talk on mechanical lubrication with suitable exhibits would provoke quite a fierce evening.

DECEMBER ON THE ROAD. Chief among the advantages of the runabout is the protection it affords to the driver. This owner of a three-wheeler does not need to don overalls and sou'wester; when the rain comes he stops and raises the hood.

A ROYAL VISIT TO THE MOTOR CYCLE SHOW.

ON Wednesday of last week H.R.H. the Duke of York arrived at the Show punctually at 10.30 a.m. to make a tour of the exhibition. He was accompanied by Wing-Commander Grieg, and was met at the Hammersmith Road entrance by Sir Harold Bowden, Bart. (President of the Manufacturers' Union), Mr. W. G. Bower (vice-president), and Mr. H. R. Watling. The first stand visited by H.R.H. was that upon which was displayed the Scott three-wheeled runabout. From there His Royal Highness visited the stands of Rudge-Whitworth, Douglas (with which he is well acquainted), Matchless, Levis, and Harley-Davidson, where he was received by Mr. Duncan Watson, and

had the two well-known Harley-Davidson riders, Temple and Davidson, presented to him. He also visited the Zenith stand, and had the beautiful section of the Zenith-Bradshaw engine explained to him by Mr. Bower, and saw the two new model Peugeots, which made their first appearance in the Show that morning. On the P. and M. stand the Duke of York had several minutes' talk with Mr. R. Moore, and asked him if the P. and M. had not been very early in the market, and he was told that the first model was on the road in 1901. On the Ner-a-car stand he shook hands with Mrs. Jansen. It is impossible to mention all the exhibits H.R.H. inspected, but he was interested in the new J.A.P. engines.

MOTOR CYCLISTS ON PAPER.

Sir,—“Motor Cyclist on Paper” certainly seems to be in a predicament, yet should be content with his lot.

I also have been a reader of *The Motor Cycle* for years, and am still waiting for someone to offer, giving one away, which as yet I have not had the fortune to perceive.

In all probability, if such did happen, I might be killed in the rush, so that “Motor Cyclist on Paper’s” hopes seem somewhat brighter than

Luton.

MOTOR CYCLIST IN DREAMS.

DIMMING BY DI-OPTRIC LENS.

Sir,—May I enquire whether the principle of the di-optric lens has yet been applied to motor head lamps? It occurs to me that an arrangement of lateral prisms of glass actuated at the ends by a rack and pinion adjustment might solve this night glare difficulty by the momentary lowering of the parallel beam in response to the simultaneous inclination of the lens prisms. The effect should be that whilst a dim light still shows ahead, that would enable any driver to pass in safety, a full beam would illuminate the road for a matter of three or four yards only, to the mutual advantage of all concerned.

H. H. CUDMORE.

STANDARD ENGINES AT BROOKLANDS.

Sir,—In answer to the queries of your correspondent “F.E.L.” (Dulwich) on the above subject, and for the benefit of any other uninformed persons, we would like to make it public (1) that Indian racing machines are taken to Brooklands by van solely because they are not equipped for the road and carry no licences or registration numbers, and (2) that the blanket coverings were adopted to prevent our “numerous admirers” from inadvertently altering careful and much sought after adjustments and flooding the crank case with oil just before a race, which has often been the cause of an engine not starting easily. Your correspondent need have no fear that the blankets are to veil some mysterious new mechanism. Moreover, it may not be common knowledge that after any important race or new records, the engine is dismantled in view of the officials for measurement and inspection, and an inquisitive public may easily satisfy itself as to standardisation.

HENDEE MANUFACTURING CO.

W. H. WELLS.

WEIGHTS OF SPORTING MACHINES.

Sir,—I see “Ixion” has got a grouse about the weight of the Ricardo-Triumph. As I am about to own one of these, I must defend it.

Could the Triumph Co. turn this machine out at 160 lb.? The frame would have to be lighter. This I should have thought impossible, considering the state of the roads now and in 1911. Also think of the much higher speeds now obtained than in those days. Again, if it were ten years ago, how could the gear box be made much lighter? I am of the opinion that for long life and “foolproofness” these boxes could not be much lighter than to-day. I owned a 1911 Triumph, and with just the plain single gear belt this weighed 170 lb. fully equipped! How “Ixion” could reduce the weight I am at a loss to know. Everyone clamours for a larger capacity tank, and this, of course, weighs more than the old square tank. Then, what with chains and larger and more solid wheels and tyres, this machine could hardly weigh very much less.

Probably I am dense. If “Ixion” can assist me in getting a 30s. tax instead of a £3 one, I shall be eternally indebted to him.

Nottingham.

TRIARDO.

GRAVITY FEED MECHANICAL OIL PUMPS

Sir,—The writer has observed with interest your notice on the Showell rotary oil pump, and would like to say, in reply to your criticism, that you are quite right in stating that oil must be led by gravity to the pump, and that the amount of pressure obtained is rather limited, but the force is such as our lengthy and varied tests have proved to be ample, and there is no need to make use of a thin oil.

During the recent cold snap, when the oil became very heavy and viscous, the writer covered a distance of about 150 miles, and this was the first occasion in eight months’ use on which it was found necessary to increase the usual valve opening.—The machine used was a 3½ h.p. B.S.A., and lubrication was everything that could be desired.

We would like to take this opportunity to point out that the flow of oil is varied according to engine speed, and, further, that the drive may not only be taken from the magneto, but also the half-time or engine-shafts irrespective of speed, as the valve in the sight does all the regulating.

We trust you will see your way to publish our letter as one of general interest.

JOHN H. COCHRANE, Sales Manager.

ELIMINATING MECHANICAL NOISE.

Sir,—With reference to the letter by “Multi Gear” which appeared in your issue of November 3rd under this heading, we would like to say that we have fitted a number of Rudge machines with enclosed overhead valve gear such as he suggests. A photograph showing this is enclosed herewith, and we have found that by fitting this type of cover a considerable amount of noise is eliminated, besides adding longer life to the various working parts.

Completely enclosing the inlet valve gear of a 3½ h.p. Rudge. (See accompanying letter from Messrs. H. V. Smith.)

HENRY V. SMITH, ENGINEERS.

Osmondthorpe, Leeds.

Showing the ladies' model spring frame P.V. lightweight in "number two" position on the new "Jackstand." The rear wheel is fully four inches clear of the ground.

SIDECAR FUEL CONSUMPTION RECORDS.

Sir,—Your correspondent "Ignoramus" must have created a record in averaging 92 m.p.g. on his 4 h.p. Triumph sidecar. I have recently made a long tour, but my average stands at 67 m.p.g. with an absolutely standard Triumph outfit—that is, as delivered from the works.

I am sure it would be interesting to know what jet and gear ratio "Ignoramus" employs. TOM HAMMOND.

REVIVING AUTOMATIC VALVES.

Sir,—Your correspondent, Mr. J. E. Smith, has opened up a deeply interesting enquiry.

I had two ancient machines—one, an old racer $3\frac{1}{2}$ h.p. Triumph, and the other, which took me thousands of miles, was a 3 h.p. Lincoln Elk. The former was mechanically valved; the latter had the automatic inlet. One advantage in favour of the Elk was that there was no blow back in the carburettor when the cylinder had become overheated. The trusty Triumph opened its valve for gas, and, at certain speeds of low rate, spat out part of the charge. I attribute this to two causes. First, the gas at sub-normal temperature suddenly expanded on coming into contact with the interior of the cylinder, and, as the inlet valve was held open, partly escaped again by the way it came in. Secondly, the indicator diagrams of all gas engines show a residuary pressure behind the piston after the exhaust period terminates.

The cure, no doubt, is to increase the speed. Then the momentum of the gas has not time to react and "about turn," and the loss is negligible. But that limits the speed range.

We must command a low speed for utility's sake. Is it not a fact that the flat part of the arc near the top dead centre is of little benefit whether the inlet valve be automatic or not?

I tried the experiment of fixing an automatic between the carburettor and the inlet valve of the Triumph, with the result that there was no blow back and no waste of gas.

I would point out one more advantage of enormous value. According to my tests, the automatic claims a distinct preference in petrol consumption in long hills or switchback roads. That, of course, is after making due allowances for greater weight carried by the "trusty" machine.

The automatic valve appears at its best when the spring approaches half the strength of that of the exhaust. Probably it would go one better if it was as wide as the bore of the cylinder, and of aluminium if practicable. And to the future of the automatic valve I raise my glass!

Stowmarket.

REACTIONARY.

Sir,—I am much interested in Mr. J. E. Smith's letter re automatic inlet valves. I have a machine in use daily fitted with valves of this type. This is a twin-cylinder Rex of 1908, and the original valves have been in use till quite recently, when, owing to the stems being somewhat worn, they were replaced by valves made of nickel steel. I have never had a broken inlet valve, and there were no cotters to wear in my case, as the collars are secured by

neat clips which cannot come adrift. Another advantage with this type of valve not mentioned by your correspondent is, there are no valve guides to leak air and prevent satisfactory running at small throttle openings.

Stewartstown.

AUTOMATIC.

Sir,—I was much interested to read Mr. J. E. Smith's letter on automatic inlet valves, and perhaps the fact of my being also a keen motor cyclist will be sufficient excuse for dragging "car discussion" into your columns.

We have a 1906 10 h.p. two-cylinder De Dion car, fitted with a.i.v. When we bought the car, it was with the intention of converting the a.i.v. to o.h.v., but I decided to give the old automatics a trial. So I ground them in well, adjusted the springs, and fitted case-hardened cotters to them.

Since then I have had no trouble with them, can start up on a frosty morning within two turns of the handle, accelerate like the very dickens, and can show the 1922 super tuned 10 h.p.'s a thing or two, will climb any hill, and take 10 cwt. anywhere.

A.I.V.

Chesterfield.

COMPARATIVE INSURANCE RISKS.

Sir,—With regard to the letter of Mr. W. Attwood-Evans in your issue of November 24th, I beg to point out to him, with due apologies, that his explanation of how and why insurance premiums differ because of horse-power does not appear very sound.

In the first place, I wonder why he should take it for granted that, generally speaking, an 8 h.p. machine covers more ground than one of a more modest power. Take the man who goes to business every day on his machine to save inconvenience and expense: does he use a big twin? I think in the majority of cases his horse-power rating would be nearer 2 $\frac{1}{2}$.

Then Mr. Attwood-Evans states that "moreover, an 8 h.p. motor cycle is . . . capable of more speed." He does not say that his remarks apply only to sidecar outfits, so, at the risk of making the big twin fans get on their hind legs and ramp, I offer my opinion that this does not necessarily follow.

There are fast—very fast—big twins on the road, but I believe it is a fact that the average $3\frac{1}{2}$ h.p. single will beat the average 8 h.p. twin when it comes to revs., and for speed you must be able to get the revolutions up, and keep them up.

The average big twin is designed mainly for sidecar work, and geared accordingly. This year's Show heralds a multitude of standard sports models, from the little o.h.v. $2\frac{1}{2}$ h.p. J.A.P. upwards. Any of these should beat an average 8 h.p. twin in a "blind," especially (*vide* our comrade "Ixion") if the twin is hauling Mr. and Mrs. Quiverful and the family sidecar.

Visions of this labour of love going into the Editor's W.P.B., and the fact that my fount pen is nearly Pussyfoot, force me to make an end, but in this last dying spurt I should like to say that it is far from my wish that Mr. W. Attwood-Evans should advocate the advancing of the premium of the small h.p. 'bus (I ride a "3 $\frac{1}{2}$ "). Rather, I hope that he may eventually come to advocate the reduction of the big twin premium.

Southport.

NICKY NICKY BOM BOM.

IN SHOW FLANNELS

This is how the hundreds of motor cycles were taken to the Show. All enamelled and plated parts are carefully bandaged for their railroad trip to Addison Road—the last, let us hope, of their career! The machine is a Silver Prince.

An interesting novelty was the cardboard model of a Norton sidecar which was much in evidence at the Show. It is seen reposing on the front of a standard model 4 h.p. Norton sidecar

ACCUMULATORS FOR SERIOUS LIGHTING SERVICES

Sir,—Relative to the letter on the above topic, appearing in *The Motor Cycle* of November 24th, signed by C. Kyle, of New Zealand, I consider it my duty to warn the motor cycling fraternity at large that our friend in the Southern Hemisphere has either underestimated the capacity of his accumulator or exaggerated the rate of discharge to an abnormal degree.

The accumulator is stated to be of the 6 volt 15 amp. type, which equals 90 watts.

Your correspondent informs you that he has the following lamps in use, and stipulates that his rate of discharge is about 10 amps.:

	amps.
Head light, 48 c.p. half watt bulb current consumption	4
Dim lamp in head light, 12 c.p.	2
Small bulb for stationary use in head light, 2 c.p.	$\frac{1}{3}$
Spot light, 12 c.p.	2
Speedometer, 2 c.p.	$\frac{1}{3}$
Tail lamp, 2 c.p.	$\frac{1}{3}$
Total consumption	9

It is now obvious that the discharge is approximately 9 amps. Now, if we divide this into our first calculation of 90 watts, we have—

$$\frac{90}{9} \div \frac{1}{3} = \frac{9}{3} = 12.$$

Therefore the period over which a 9 amp. discharge could be held from the cells previously stated is nominally $\frac{1}{3}$ hour.

We will now turn our attention to the distance covered, which is fifteen to twenty journeys of ten miles each.

In order to spare our friend too great an exposure, we will accept the lowest number of journeys for our basis.

Fifteen journeys of ten miles each equal 150 miles. Now, if we divide the number of discharge hours into the mileage covered we will arrive at the speed necessary to complete that distance during the discharge of the accumulators through the lamps:

$$\frac{\frac{1}{3} \text{ hour}}{150 \text{ miles}} = \frac{1}{3} \div \frac{1}{30} = 90 \text{ m.p.h.}$$

The cells under discussion are of the secondary type, therefore recuperation through chemical action is of no account.

My own mount, "a reliable Velocette," is equipped with C.A.V. electric lighting, minus dynamo, and using the same size of accumulator as our friend, and with a maximum discharge of $2\frac{1}{2}$ amps. I can only obtain six hours continuous light.

Ten years in close contact with the electrical trade has not brought me in touch with any secondary cell that can boast of an efficiency anything near that claimed by our friend from overseas.

A.F.W.W.

Lyynn.

SUNDAY COMPETITIONS.

Sir,—I read with much incredulity parts of the letter written by Mr. Samuel St. John.

He says, "During the week the 'man in the street' endures even speed trials without kicking." May I ask, Who is the "man in the street"? Does he stay at home to earn the wherewithal to exist? No. Then, perforce, he is not troubled at all through the week by the pandemonium created by all the known makes of motor cycles (barring the bare half-dozen) competing in speed trials, etc.

With regard to Sunday, how many "men in the street" would stay at home and have rest and quiet in preference to watching a hill-climb or a speed trial, which, owing to the proximity of the noise, could not entail a walk of more than a few hundred yards?

EF 1508.

West Hartlepool.

SIDECAR POWER IN TRIALS.

Sir,—I am one of the majority which does not go in for freak trials, but desires a low cost sidecar outfit to take two heavy persons anywhere in reason in England or Wales. (I exclude the big Scottish passes.)

The point I want to raise is this. Why is it that in reliability trials, such as A.C.U. Six Days (to which the public turns its eyes for a guide as to the capabilities of machines), there is so seldom seen a representative number of single-cylinder four-stroke sidecars just under 600 c.c.?

A number of makers of excellent 4 h.p. engines catalogue a sidecar outfit of this power, which will no doubt "go anywhere." Why then, when it comes to a trial, do these manufacturers enter their machines solo?

Supposing this year's boycott of the A.C.U. Six Days Trials had not occurred, would the man of very reasonable requirements have had a chance of seeing the numerous 4 or $4\frac{1}{4}$ h.p. sidecars in operation? For answer to this, one has only to look at the records of previous trials. There was one notable exception this year, I know (though only a $3\frac{1}{2}$ h.p. sidecar); but this is only the exception which seems to prove the rule that manufacturers are willing enough to sell their 550-600 c.c. sidecars to the public, but when it comes to big competitions, practically the only ones one hears of are of 6-8 h.p. (I am entirely omitting the wonderful lightweight of about $2\frac{1}{2}$ h.p., as these are of another class altogether.)

The fact that at least one famous make of 4 h.p. engine pulls touring sidecars in considerable numbers about Cornwall only mystifies me the more as to the reason why makers appear disinclined to show the capabilities of the 4 h.p. in trials as a passenger machine. If a 4 h.p. could not go through such trials as the Six Days solo, when lightweighters can and do, the maker would, I hope, have to close down. Why not, therefore, show the man of moderate means that the single-cylinder sidecar, which any agent is ready to sell him, can answer all reasonable requirements? Not once or twice, but keep on showing him.

'THE MOTOR CYCLE' ROUTE BOOK.

With 32 pages of Road Maps. Price net, 5/- By post, 5/4.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

THREE PROBLEMS.

Readers' Views on Some Mysterious Troubles in Engines and Transmission.

IN a recent issue of *The Motor Cycle* (page 532) there appeared three letters from readers who had experienced various apparently unaccountable troubles with their machines. Many and varied attempted solutions have reached us, of which we append a selection below.

"Silenced" (Battle, Sussex) has also experienced "Mechanovice's" trouble, which was a periodical change in the exhaust note of a Union two-stroke engine. He writes:

"I am having a somewhat similar trouble with a single-gear 2½ h.p. Metro-Tyler two-stroke. Some months ago it suddenly developed a fit of running silently (or practically so) in the same way as 'Mechanovice's' engine, only it would start doing so in about one and a half miles, and the power seemed to remain about the same. After a few weeks of this it left off. Then, about a month ago, it started again, only this time the procedure was for it to run normally, with a crisp clear 'pop' for perhaps one mile. It by that time 'warmed up.' Then one suddenly becomes conscious that it is 'four-stroking,' but the note of each explosion and the volume of the sound remain exactly normal, and it is still possible, by enriching the mixture (with a variable jet), to produce the usual 'loud-banging' four-stroking! After a few hundred yards the explosive noises cease, and there is just a low 'burring' throb, with sometimes, at first, occasional outbursts of the apparent four-stroking. As soon as I reach a hill now I find that I have, not more power, as the lucky 'Mechanovice,' but about half the usual. Sometimes there is practically normal power, and I sail up hills the perfectly silenced motor cycle, envied for the efficiency of my silencing system. Usually, however, I gradually lose speed, until, at about 8 m.p.h., the exhaust wakes up too late to accelerate.

"One peculiar thing is that, on shutting the throttle when running 'silent' (at about 20 m.p.h. or more), the exhaust may still be heard, just the same throbbing note, but very quiet. When speed has reduced to about 5 m.p.h. the noise suddenly increases and takes the form of a hollow sort of 'bob, bob, bob,' the noise that one might expect from the expansion of gases compressed in the cylinder by the piston (i.e., not under the high pressure of an explosion). This rather led me to suspect a choked exhaust, so I cleaned everything, with no effect whatever, except the addition of a 'tinny' quality to the normal exhaust note when present.

"Incidentally, when running 'silent' and pulling (?) on a hill, it is liable to a horrible rattle, which may be cured by closing the air control.

"Does 'Mechanovice' live in Whatlington, Battle, Sussex? If so, I should like to meet him and congratulate him on his machine's behaviour!"

Short Induction Period Blamed.

The same problem has inspired the following letter from Mr. H. W. Ayres:

"These engines (Union two-strokes) will take a tremendous amount of advance, and, from twelve months' experience, I can say that they run their best at a speed of 30 m.p.h. I find that it is at this speed that my exhaust note changes to a mere murmur, after a few miles' constant running. My only explanation is this. When the engine gets its revolutions up and doing about 1,800 a minute, the carburation is near perfection, and, owing to the extremely short induction period of the Union engine, only a very small charge is drawn in, which is at the same time ample enough to keep the revolutions up, as the compression of the engine after a long run is much better than it is at a start. The increase of power noticed by 'Mechanovice' is not a fallacy but an absolute concrete statement, as my experience with two up confirms his observation without doubt.

"Four-stroking is rather a nuisance with these engines sometimes, but a variable jet is what is wanted, as the engine requires very little juice on the road."

Mr. W. M. Norris suggests a cure. He writes:

"I have had the same phenomenon with my 1921 Levis engine. Perhaps my experience may be of some use. I

had fitted an extra air tap to the induction pipe, which had an inside diameter of about ⅝ in. When the engine had got thoroughly warmed up the exhaust note suddenly changed to a much higher key. After running like this for about fifteen miles I noticed that the silencer was abnormally hot and the copper exhaust pipe had changed to a dull black colour, so I had the extra air tap soldered up, and have not had the trouble since, except the other day, when I was trying an old Bosch aeroplane plug, the electrode of which was a bad fit. So I have come to the conclusion that too much extra air is the cause of the trouble, but why this should be so I should be interested to find out. In regard to the four-stroking, I should advise him to fit a W.S.R. variable jet and a small extra air tap in the induction pipe which will close properly."

Blowback at the Valves.

Valves failing to seat properly was "Mechanic's" difficulty with his Humber. "W.B.W." (Ilkley) makes the following suggestions, and also adds a note for the benefit of "Mechanovice":

"A number of years ago we had a similar trouble with a 1905 semi-water-cooled 3½ h.p. White and Poppe single. We found the trouble to be that the valve seating became distorted when the 'holding up' bolts or studs were drawn up tight enough to ensure a good joint.

"We were able to effect a permanent cure by fitting a bridge piece across the valve guide between the top end of the valve spring and the face, where the latter normally had its bearing. The extremities of the bridge piece were drilled and tapped for the insertion of extra long bolts or studs, and the originally tapped holes in the valve seat flange were drilled out to allow these to pass through, as in the cylinder head. This allows the valve seat to be held up by pressure applied at a central point.

"Mechanovice" might fit a magneto cut-out and use it the next time a change of tone occurs, and we think he will find that his engine will run without the usual ignition system, and prove 'self-ignition' to be the cause of change in tone of exhaust. The reason of self-ignition may be found to be a defect in the engine design and of carburation. We guess that 'Mechanovice' has not tried any fairly steep hills when this condition is in evidence; as any reduction in 'revs.' would soon alter the situation."

"Chainman" desired help in locating "an objectionable rumble" in his all-chain drive big single. Mr. W. Dougall reports a similar trouble, and suggests a cause:

"My machine (a Triumph) is in exactly the same condition, but, unlike your correspondent, I know what caused it, but, so far, have not effected a cure. While standing, a car came out of a side road, and, before it could be drawn up, it slowly bumped my sidecar, slewing the frame connection on the front down tube round so that the point of the side touched the ground. I thought I had escaped, but now find the engine in exactly the same state as described by 'Chainman.' Evidently the frame has got a twist, although not noticeable, and the engine is off the balance. I am of opinion it will be difficult to put right."

"J.G." suggests a solution:

"Do you think it could be caused by a loose baffle plate or loose end on his expansion chamber? When he shuts off the gas and allows the machine to drive the engine, air would be drawn through the exhaust system, and anything loose may account for this mysterious noise."

"Jockell" (Brighton) attempts to solve all three problems, in the order referred to above.

"(a) Compression too low. (b) Temporary binding of operating rockers owing to heat and under-lubrication. (c) Either (1) sprocket on wheel eccentric to wheel axle. (2) hub ball races require renewal or adjustment, or (3) wheel out of truth. I would add that identical troubles occurred to me with, in the case of (b), a 2½ h.p. Douglas, and (a) an old 2½ h.p. Minerva."

Weather Protection on a Solo Machine.

How Overheating was Eliminated when Using very Complete Leg and Engine Shields.

WITH the approach of the winter season and the cold, wet weather which normally follows in its train, many motor cyclists may perhaps be interested in, and welcome, the following device, which greatly increases the joy and comfort of winter riding, and not only prevents saturated trousers but also shields the legs from the biting winds which are prevalent during this time of the year. The total enclosure of the front of the engine keeps the whole unit quite free from dirt and wet in a most surprisingly effective manner.

The writer has been in the habit of riding to and from business four times daily on a 4 h.p. Douglas solo machine, and, because of the discomforts above-mentioned, has sought to remedy the trouble in the manner illustrated.

Polished Aluminium and Beaded Edges.

The shields, which are made of No. 16 gauge sheet aluminium, are polished, and present outwardly a very smart and symmetrical appearance. The insides are enamelled blue to match the Douglas blue of the tank. Around the edges have been riveted some $\frac{3}{16}$ in. aluminium beading, which not only strengthens the shields, but also adds to the appearance, giving a finished-off effect. Being in two halves, the work of assembling to the machine is simple and is accomplished by bolting the two halves together and screwing the base to the footboards with half-a-dozen screws. The whole is quite free from any vibration or rattle.

Since the shields were fitted a year ago, the machine has been ridden every day during all weathers—wind, rain, hail, and snow, and even during the hurricane winds which were so frequent during the latter end of last year, and which have tested the machine thoroughly, both from the wind resistance point of

view and also from the skidding danger. Incidentally, discs are fitted to the wheels. Yet several of the writer's engineering friends prophesied trouble from the following three sources: (1) Cylinder overheating; (2) wind resistance; (3) skidding.

In order that the whole of the engine and the legs of the rider might be fully protected from the road mud, it became evident that some provision for the cooling

of the cylinders was necessary. To effect this, a hole of rectangular shape, 4×5 in., was cut out of the aluminium directly in front of the front cylinder head; but in practice this was found to be an uncertain and somewhat erratic method, for when riding it was found that only a small amount of air was driven by the forward motion of the machine through the hole in the guard, owing to the front wheel mudguard covering it. In order that a positive system of cooling could always be available, an arrangement was designed whereby a fan was mounted on the two frame tubes (see sketch) between the opening in the shields and the front cylinder head, driven at twice the engine speed.

The drive to the fan was accomplished by fitting a plated V driving pulley on to the crankshaft and flywheel, secured by the flywheel nut. This pulley drives in the opposite direction to the engine—by means of a quarter-round crossed leather belt—a countershaft situated on the two front tubes about seven inches below the fan bearing. The axis of the countershaft being parallel to the axis of the engine crankshaft, it became necessary to arrange a right-angled drive from the countershaft to the fan.

Effect of Fan Cooling.

Another small V pulley was then fitted between the tubes on the countershaft, and another quarter belt fitted to that pulley and the fan. The fan thus rotates in a clockwise direction when looking at the front of the engine, the fan blades being so designed to suck in air through the opening in the shields. The action of the fan is quite successful, drawing in air through the hole provided, and throwing it on to the front cylinder, where it streamlines down the cooling fins, then strikes the crank case. So positive was the action of the fan that it was found unnecessary to use it on moderately cold or very cold days. Putting the fan out of action is a simple matter of but a few seconds, by just slipping off the belt from the flywheel to the countershaft. There is but little noise to object to in the operation of the fan, and the whole arrangement is of simple, light construction, and was fitted up at a very moderate expense.

With regard to wind resistance, it is not the writer's intention to claim that there is none, but it has not been noticeable excepting when "all out."

R.W.S.

Although fitted with these ample shields, the appearance of the machine is not spoilt in any way, nor is the petrol consumption appreciably higher.

The shields fitted to the writer's Douglas, which have proved very satisfactory in use.

Arrangement of the fan drive, shown diagrammatically.

Motor Cycles in Australia.

1,742 British motor cycles were imported by Australia during August, and 399 from the U.S.A.

U.S.A. Exports of Motor Cycles.

No motor cycles were imported by the U.S.A. during September, during which month 627 were exported.

Oil in the Antipodes.

Several companies have been formed in Australia and Tasmania to develop oil fields in those countries.

Cheltenham.

The A.A. informs us that the authorities at Cheltenham are just now very energetic, and advises members to observe special caution when passing through this town.

Two-strokes and Records.

Over 63 m.p.h. for ten miles is a remarkable speed for a 250 c.c. two-stroke. Judd's Show time record speed on his Velocette was 63.09 m.p.h., which shows the great advance made in two-strokes.

Some Spring Frame!

Olympia always produces a few good stories, and the dense fog in the early part of the week provided admirable scope for yarn weavers. It was said, for instance, that a well-known figure in the motor cycle world rode to the Show through the dense pall, and was impressed by the life and acceleration of his engine. He discovered after some minutes that his gear lever was in neutral and his machine stationary!

A.C.U. General Committee Meeting.

The General Committee of the Auto Cycle Union will hold its last meeting of the 1921 session at the Grand Hotel, Bournemouth, at 10 a.m. on Saturday next, when an important agenda will be considered. The meeting will be preceded on Friday evening by a dinner at the Grand Hotel. For this function invitations have been accepted by His Worship the Mayor of Bournemouth (Ald. C. H. Cartwright, J.P.), the Town Clerk (Herbert Ashley, Esq.), the Borough Surveyor (F. P. Dolamore, Esq., F.S.I.), the President of the Bournemouth and District Motor Cycle Club (Dr. Geo. Frost, J.P.), and the Chief Constable of Bournemouth (Superintendent Garrett). The Bournemouth Club and local motor cyclists generally, as well as a number of influential local residents, are expected to support the function.

Through Feminine Goggles.

Three ladies contribute to our pages this week: Miss Helen McKie, Mrs. Lockwood-Tatham, and Miss Peggy Fraser.

Another Winter Trial.

Following on the M.C.C. London-Exeter-London run on Boxing night, there comes an open twelve hours winter reliability trial organised by the North-west London M.C.C. The route is from London to Gloucester and back to London, and with it will be combined an inter-club team competition for the Twenty-five Guineas Service Challenge Cup, confined to clubs in the South Midland A.C.U. Centre.

It will be a straightforward reliability run of about twelve hours on roads which are not of a freakish character, but are, nevertheless, sufficiently severe under winter conditions to make a first-class award worthy of effort. The times have been scheduled to necessitate the lighting of lamps on the homeward journey only.

The start will take place from Jack Straw's Castle, Hampstead Heath, at 8 a.m. on Saturday, December 31st.

H. H. Bowen, who, on a twin Martinsyde (745 c.c.), beat the fifty miles and one hour records in the 750 c.c. class, his times being 79.21 m.p.h. and 78.15 m.p.h. respectively.

Special Features.

1922 LIGHTWEIGHTS.

FROM THE PASSENGER'S POINT OF VIEW.
LESSONS OF THE SHOW.

Proprietary Engines at Olympia.

Of the proprietary engines exhibited at Olympia last week, 129 were J.A.P., 28 M.A.G., 39 Blackburne, 18 Liberty, 9 Bradshaw, 42 Villiers, 2 Morris, 5 Abingdons, 1 Barr and Stroud, and 1 Jukes.

Perversity.

A Harrogate motor cyclist is awaiting a summons on at least two counts; he left his machine unattended outside a shop on a hill. The machine ran away, and, after a wandering rush down hill, finally knocked over a policeman on point duty. Perhaps it was some such incident that inspired the P. and M. ratchet brake.

The Small Engine.

Teacup engines are coming into their own. Not many years ago the 500 c.c. engine was considered scarcely big enough for passenger purposes, yet now there is a steady increase in the number of machines of under 350 c.c. which are being turned out specially for sidecar work.

Pin-pricking Prosecutions.

A tester of one of the Midland firms of motor cycle manufacturers has been summoned for having a passenger in the sidecar of a machine bearing trade numbers. On this particular occasion the machine was undergoing tests in connection with its passenger capabilities.

More Show Time Records.

Following on the healthy list of records appearing in our last week's issue, efforts in this direction during the Show period came to a conclusion on Wednesday, when the track was closed for repairs.

On Tuesday, the 29th ult., E. B. Ware, on a Morgan-Jap (85.5x95 mm., 1,096 c.c.), captured two Class H2 (cycle cars up to 1,100 c.c.) records, covering the five miles flying start in 3m. 46.97s. = 79.30 m.p.h., and the ten miles standing start in 7m. 55.14s. = 75.92 m.p.h.

In Class D, H. H. Bowen brought further success to the louse of Martinsyde, riding a machine with a bore and stroke of 70x96 mm. (745 c.c.), covering fifty miles in 37m. 52.2s. = 79.21 m.p.h., while in the hour he covered 78 miles 267 yards = 78.15 m.p.h.

On the last day of November, G. Dance, on a 3½ h.p. overhead valve Sunbeam (85x88 mm., 499 c.c.), added to his last week's magnificent performances in Class C by capturing the five miles flying start in 3m. ... = 87.35 m.p.h., and the ten miles standing start in 7m. 15.36s. = 82.67 m.p.h. A notable feature of the ride was that in the five miles record he covered two laps in exactly the same time. It will be remembered that during the previous week he obtained the wonderful speed over the kilometre of 93.99 m.p.h.

An Offer!

We will buy your present magneto,

should you desire to replace it with a B.T.H. "Sparklight" combined ignition and lighting set.

Write for particulars of the B.T.H. "Sparklight."
 Quote CM812

"Sparklight" Sets can now be supplied in three types, for two-stroke and four-stroke single solos, and four-stroke single combinations, **complete at £13 10s., £16 16s., and £17 10s. respectively, and for your replaced magneto we offer £2 10s**

The
British Thomson-Houston Company Limited,
 Lower Ford St., Coventry.

Quarterly Licences.

It is now definitely settled that motor cyclists may take out quarterly licences, instead of being compelled to pay the full amount in one payment. The short period licences come into force on January 1st next.

Three-wheelers.

Most of the manufacturers of three-wheeled runabouts now offer models at a price competitive with the big twin sidcar outfit. The Morgan short wheel-base model is the lowest in price. £150; the L.S.D. comes next at £165; and the air-cooled T.B. £175. All these are two-seated models, and not, as seems to be thought in some quarters, single-seaters.

Solid Reward.

A sound idea in competition organisation is incorporated in the Bradford M.C.C. winter trial on December 11th. At the end of the outward journey (to Morecambe) a substantial north-country mid-day dinner is to be provided for all competitors—soup, fish, joint, poultry, plum pudding, and "etc." are on the menu—and with a 5s. entry fee withal everyone should check in, at any rate.

Two Hundred Miles Sidcar Race.

As has already been announced, the Ealing and District M.C.C. intends to hold a 200 miles sidcar race on Brooklands on July 29th, and it has been provisionally decided to give awards in the standard capacity classes: 350 c.c., 600 c.c., and 1,000 c.c. The suggestion has also been put forward to arrange some form of handicap, so that the first man to complete the 200 miles, irrespective of class, will be the winner of the chief award, the idea being to sustain public interest throughout the race.

Reunion of Ex-D.R.'s of the 1st Corps.

It is proposed to hold a reunion of the ex-D.R.'s of the 1st Corps in Birmingham on a Saturday in January or early February. Railway fares will be pooled. A dinner is suggested, followed by a visit to a theatre. Ex-D.R.'s who were attached permanently or temporarily to the 1st Corps, who would support the scheme, should write to Mr. J. W. Ordish, Solihull, Birmingham. Sufficient promises to make the gathering a success have already been received.

The Wonders of Science.

Imagine a device which enables one to see and measure the "bounce" of a valve on an engine which is running at full speed, or to watch the points of a magneto contact breaker gently opening and closing, though the armature is revolving at 2,000 or 3,000 r.p.m.! Suppose that one could see the globules of petrol passing slowly down an inlet pipe, or exactly locate a knock in the engine. Fancy examining the engagement of sprocket tooth and chain at high speeds, or optically measuring the vibrations of a tank. With these facilities, would it not be possible to design more efficient and quieter engines and transmissions? Yet these things and many others have been made possible by the oscilloscope, a new invention of Mr. A. Elverson, an instrument developed during the war in connection with aero engines.

100 m.p.h. and the Single-cylinder Machine.

When will 100 m.p.h. be attained with a 500 c.c. engine? Dance's figures (93.99 m.p.h.) indicate that this speed will soon be reached.

An Anglo-American Production.

Many months ago the patent files gave us the clue that the Ner-a-car was an American conception, and also that the name was a contraction of that of its designer, Carl A. Neracher. The Ner-a-car is now being manufactured in America on practically the same lines as the English production, which, incidentally, owes to British brains some of its constructional features.

Entries for the London-Exeter.

One hundred and forty entries have been received for this year's London-Exeter-London run of the M.C.C., but it was expected that there would be one or two additions to the list before it finally closed last night. Thirty-six solo machines, sixty-two sidcar outfits, one three-wheeler, and forty-one cars have been entered.

The New M.C.C. President.

It is scarcely correct to refer to Mr. J. K. Starley as the president elect of the Motor Cycling Club, but the fact remains that he has been asked if he would act in that capacity, and has accepted, so it is foregone that he will be enthusiastically chosen at the next A.G.M. of the club. Mr. Starley is naturally best known for his connection with the Rover Motor Co., Ltd. He has always been a thorough sportsman and a true motorist, and a senior member of our staff has recollections of him driving between the works and his home on a 3½ h.p. Rover with a forecarriage attached. On this machine Mr. Starley always carried a bicycle saddle in front, so that, if necessary, he could give anyone a lift.

Joining the Fraternity.

There will be thousands of new motor cyclists next year, if the interest displayed at Olympia is any criterion.

Next Year's Paris-Nice Trial.

Next year—the Paris-Nice trial will not be organised by the Moto Cycle Club de France, which will have its hands full with the Tour de France, but will be in the hands of the Automobile Club of Nice. The trial is arranged for the beginning of March, and at Nice there will be hill-climbs, a kilometre speed trial, and other competitions.

The Film during Show Week.

A most excellent reception was accorded *The Motor Cycle* film exhibited all last week at the Poly Cinema, Regent Street, W., on the occasion of the Motor Cycle Show. A large number of motor cyclists who visited Olympia took the opportunity of seeing the chief events in the motor cycle world of 1921 on the cinema, and accorded the film an enthusiastic reception, and in the majority of cases clapped enthusiastically at the termination of the film—an unusual proceeding at a picture house.

London-Gloucester-London.

Instead of gold medals, silver caps will be awarded to all competitors gaining 95% marks in the N.W. London M.C.C. open London-Gloucester-London trial, which will be held on the last day of the year, Saturday, the 31st inst. It will be a straightforward run of about twelve hours over roads which are not of a freakish character, but, nevertheless, sufficiently severe under winter conditions to make a first-class award worthy of effort. An inter-club team competition, confined to South Midland clubs, will be included. Entries, which should be sent to Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, N.3, close on the 24th inst.

**A HAPPY GLIMPSE OF SOUTH AFRICAN CLUB LIFE.**

October sunshine in East London (South Africa) greeted the speed-guessing non-stop competition of the local motor cycle club, which was held on the 30th of that month. Here is a cheerful group just previous to the start.

Quarterly Licences for Motor Cycles.

Full Details of the New Scheme for 1922.

AS previously forecasted in *The Motor Cycle*, a system for issuing quarterly licences comes into force from January 1st, 1922. The rates at which the new licences will be issued are substantially three-tenths of those for the full year. If the owner of a motor cycle desires to take out a licence for the whole year, and has previously held one, he may apply for a renewal at his local Post Office, but if, on the other hand, he wishes to take out a quarterly licence he must apply to his local registration authority, the address of which can be obtained by enquiring at a Post Office. So far as the colours of the licencing cards are concerned, these are the same as for motor cars.

From the instructions given on the application form for a quarterly licence, it will be seen that these licences expire on March 24th, June 30th, September 30th, or December 30th. The following shows exactly how the different classes of motor cycles are affected, how much each has to pay for a quarterly licence, and the method in which the application is made:

APPLICATION.

I apply for a Licence expiring on 192.... for a—	Annual Licences, Expiring on 31st December.	Quarterly Licences, Expiring on 24th March, 30th June, 30th September, or 31st December.	Amount to Pay.
Motor Cycle (or motor scooter or cycle with auto-wheel or other motor attachment).	Dnty.	Duty.	£ s. d.
NOTE.—Motor Cycles exceeding 8 cwt. in weight unladen are chargeable to duty as cars.	£ s. d.	£ s. d.	£ s. d.
(a) Bicycle—			
Weight unladen not exceeding 200 lb.	1 10 0	10 0
Ditto, with right to draw trailer or sidecar	2 10 0	15 0
Weight unladen exceeding 200 lb. but not exceeding 8 cwt. ...	3 0 0	1 0 0
Weight unladen exceeding 200 lb. with right to draw trailer or sidecar	4 0 0	1 5 0
(b) Tricycle (not exceeding 8 cwt. in weight, unladen)	4 0 0	1 5 0

After this the applicant has to give various particulars, which are tabulated in the following manner:

- (e) Has the vehicle been previously registered under the Roads Act, 1920
- If not—
- (i.) Is it a new vehicle?
- If so, evidence of this, such as the manufacturer's or an accredited agent's invoice, etc., should be supplied.
- (ii.) If not a new vehicle, a satisfactory explanation must be supplied as to why it has not been previously registered
- (b) Registered Mark and Number (if any)
- (c) Is it a Bicycle or Tricycle?
- (d) Is it used for drawing a Sidecar or Trailer?
- (e) Make of Vehicle
- (f) Manufacturer's Number of Engine
- (g) Manufacturer's Number of Frame
- (h) Type or Model of Vehicle
- (i) Manufacturer's Horse-power
- (j) Weight of Bicycle or Tricycle unladen

It will be noticed that the weight of a motor cycle is the weight unladen, but further on it is stated in the new application form that the licensing authority may require the owner of any motor vehicle to furnish such evidence as to the accuracy of the particulars declared as may be deemed necessary. This means that a motor bicycle may be weighed unladen; that is to say, without fuel and oil, and, so we understand, without detachable accessories such as horn, mirror, lamps, accumulators, but would not entitle the owner to remove such fittings as footrests and toolbags, which are essential parts of the machine, though, of course, the tools may be removed for this purpose. It is also inferred that in case of dispute, the machine may be weighed and a certificate of weight demanded, or it may have to be weighed in the presence of a duly authorised officer. The new form also gives clearly the definition of a motor cycle and exemptions:

(1.) The term "motor cycle" includes any mechanically-propelled vehicle with less than four wheels, weighing not more than 8 cwt. in weight unladen, but does not include a vehicle adapted and used for invalids and weighing not more than 5 cwt. in weight unladen.

(2.) The term "unladen weight" as applied to motor vehicles means the weight of the vehicle, inclusive of the body and all parts (the heavier being taken where alternative bodies or parts are used) which are necessary to, or ordinarily used with, a vehicle when working on a road, but exclusive of the weight, fuel or accumulators (other than boilers) used for the purpose of propulsion, and of loose tools and loose equipment.

(3.) Licences are not required for vehicles used by a local authority for fire-brigade purposes, but each vehicle must be duly registered by the licensing authority, within whose area it is kept and used.

Next Year's Important Dates.

PROVISIONAL dates for next year's important competitions were decided at a meeting of A.C.U. Centre representatives held at the Royal Automobile Club on Wednesday of last week.

Next year the Scottish Six Days Trial will be held in the first week in May, and the Tourist Trophy Races at the end of that month. The Junior race will be held on Tuesday, May 30th, and the Senior event on Thursday, June 1st. The 3rd of June is Whit Saturday, but it is not yet known whether the date of the M.C.C. London-Edinburgh run will be modified in consequence.

The other International events—the Grand Prix, the Swiss Six Days Trials, and the A.C.U. Six Days Trials—have been arranged for, respectively, the

middle of July, the beginning of August, and the end of August. Both the Stock Machine Trial and the 500 Mile Race are also to be held next year.

Mr. T. W. Loughborough, secretary of the Auto Cycle Union, explained that the meeting had been called to fix dates for the various open competitions to be held next year, so as to avoid clashing and so far as possible to ensure each club—getting the particular date which it favoured allotted to it. He pointed out that the General Committee of the Union had decided to limit the number of open competitions in 1922, apart from the four A.C.U. events, to one in each local centre of the Union—a policy which should meet with the approval of all those who felt that there were too many events this year.

Next Year's Important Dates.—

The following programme was drawn up:

Wed., March 15th.—A.C.U. One Day Stock Machine Trial.
Thurs., March 23rd.—East Midland Centre Reliability Trial.
Sat., April 1st.—Western Centre Hill-climb.
Sat., April 8th.—B.M.C.R.C. Members' Meeting at Brooklands.
Sat., April 22nd.—N.E. Centre Reliability Trial.
Sat., April 29th.—S. Midland Centre Hill-climb.
Mon., May 1st, to Sat., May 6th.—Scottish A.C.U. Six Days Trials.
Sat., May 6th.—B.M.C.R.C. Members' Meeting.
Sat., May 13th.—Northern Centre Reliability Trial.
Sat., May 20th.—S. Western Reliability Trial.
Tues., May 30th.—A.C.U. Junior T.T. Race.
Thurs., June 1st.—A.C.U. Senior T.T. Race.
Sat., June 10th.—B.M.C.R.C. Open Meeting at Brooklands.
Sat., June 17th.—Yorkshire Centre Colonial Trial.

Sat., June 24th.—Midland Centre One Day Reliability Trial.
Sat., July 1st.—Eastern Centre Speed Trial.
Sat., July 8th.—S.E. Centre Speed Trials or Reliability Trial.
Sat., July 15th.—E.S. Wales Centre Speed Trials or Hill-climb.
Sun., July 16th.—Union Motocycliste de France Grand Prix (U.M.F.).
Sat., July 22nd.—B.M.C.R.C. 500-mile Race at Brooklands.
Sat., July 29th.—N. Western Centre Speed Trials or Reliability Trial.
Thurs., August 3rd, to Tues., August 8th.—Union Motocycliste Suisse (Geneva) International Six Days Trial.
Sat., August 12th.—B.M.C.R.C. Members' Meeting at Brooklands.
Sat., August 12th.—North Wales Centre Reliability Trial.
Sat., August 19th, to Sat., August 26th.—A.C.U. English Six Days Trials.
*Sat., September 9th.—W.S. Wales Centre Speed Trials.
Sat., Sept., 23rd.—B.M.C.R.C. Members' Meeting at Brooklands.
Sat., Oct. 21st.—B.M.C.R.C. Championship Meeting.
Date undecided.—Arbuthnot Trophy Trial; Anglo-Dutch Trial.
*This may be altered later to a Thursday in late July or early August.

THE BRUSSELS SHOW.

The Motor Cycle Section of the
Belgian Automobile Exhibition.

British, French, and American
Makers are also Represented.

At the Belgian Motor Show, which opened in the Palais du Cinquentaenaire, Brussels, last Saturday, and is still in progress, classes are provided for every type of petrol-propelled vehicle, and motor cyclists consequently have their own section. The Belgian makers and agents, however, consider that their interests are best served by an independent motor cycle show, opening at the end of the winter season, just in time for spring buying. This purely motor cycle exhibition takes place in Brussels about the end of February, and unites all the native makers and practically every agent for foreign machines.

From the standpoint of the motor cycle enthusiast, the Show now in progress is not of very great importance; the two-wheelers are dwarfed by the cars and lorries. It is too early to place orders for the 1922 season, and many well-known makes on the Belgian market are not represented.

Although this exhibition is incomplete from a motor cycle standpoint, it indicates that the movement is in a flourishing condition. In August, 1914, there were 11,000 motor cycles in service in the whole of Belgium. This summer the number of registrations increased to 20,000. The full import of this growth will be realised if it is remembered that the home factories were completely wrecked at the end of 1918, and only began to get into working order towards the end of 1919. Unlike England and France, there is hardly any cycle car movement in Belgium; the motorist must take either a full sized car or a motor cycle. The explanation generally given for the lack of development of the cycle car is that the roads are too bad for this class of vehicle.

If this be true, it is wonderful testimony to the value of the motor cycle. Belgian roads are famous—or rather infamous—for their *paré*, which is guaranteed to shake to pieces any but the best made car, but which, as figures show, do not arrest the development of the motor cycle movement.

Although there is a vigorous native industry, British motor cycles are more extensively used and more highly appreciated in Belgium than in any country in the world. This show is not entirely representative, yet among the British makers showing either directly, or through agents, were Douglas, Abingdon, Sun Vitesse, and Rover. Many of the Belgian machines, too, are dependent on the British industry for all or some of their components. The Jeey-Vea, for instance, has the Coventry Victor flat twin engine, and an English gear box, chains, and tyres. The Rush, a new Belgian make, is presented in two models, one of which has a J.A.P. twin engine, the other a J.A.P. single, both with gear box and chain-cum-belt drive from the North of the Channel.

America is represented with the four-cylinder Henderson, the four-cylinder Ace, and Harley-Davidsons. The only Italian machine seen in the Show was the single-cylinder side-by-side valve Frera. France was represented by the single-cylinder water-cooled Viratelle, built at Lyons, and by

Peugeots, Griffons, and Aleyons. Other French makers are on the market, but did not show.

Among the Belgian novelties was the appearance of the new two-stroke Gillet, increased in size to 350 c.c. This new model has an aluminium detachable cylinder head of such a shape as to receive the deflector on the piston. The most important claim made for this is that it sets up turbulence in the cylinder, and thus eliminates any tendency for the engine to four-stroke at low speeds. There is better cooling and generally increased efficiency by reason of the aluminium head. The firm claims that with this new model, fitted with Amac carburetter, it gets excellent slow running. The machine, which is a very fine example of Belgian construction, has two speed gears inside the base chamber and final drive by belt. Another and more powerful Gillet model has just been put on the market with the M.A.G. twin-cylinder engine.

The Fabrique Nationale, of Herstal, better known in England as the F.N., naturally occupies the leading position on the Belgian market, and made a big display both of the single and the four-cylinder models, with mechanically operated overhead inlet valve and shaft drive. These models, however, were the same as those exhibited at Olympia, and, consequently, do not call for any detailed description.

Some attention is being given to that type of lightweight closely related to the motorised bicycle class. One of the newcomers in this class was the Ideal, built at Herstal, with a small two-stroke engine, expanding pulley, and round belt drive. Attention has also been given to machines for wounded soldiers, one of the best of these being the Mignon, for men who have been deprived of the use of their legs. The machine is a four-wheeler, with a single-cylinder engine under the seat, lever starting, two speeds, and final drive by chain.

Effect of the Rate of Exchange.

British motor cycle accessories are very much in evidence; but, lest readers should be tempted to imagine that Belgium is a happy hunting ground for English makers, it should be pointed out that the high rate of exchange, and particularly its unstable nature, gives dealers many a sleepless night. Because of this situation, there is a reluctance to quote prices unless immediate delivery can be made. If there is any delay in getting deliveries from the factory, or in disposing of stock, it often happens that profit is transformed into a dead loss.

THEY SAY— WHAT DO THEY SAY?

A Mixed Grill of Conversational Fragments
heard in Odd Moments at Olympia

NOT the least important function of the Show—our Show!—is the opportunity it affords of reunions and discussions between riders, designers, and manufacturers.

A benign influence pervades the atmosphere at Olympia, and rivals who do not know each other for fifty-one weeks of the year unbend into mutual confessions regarding their products. To drift into the throng of a mixed party of technicians, engineers, and journalists is to gain an opportunity of hearing many more topics discussed with candour and pungency than there are items in Lyons *hors d'œuvres variés*, which most of the crowd recognise as the 1920 type with unchanged specification.

Overhead versus Side-by-Side.

This year the high efficiency men are assuring all and sundry that at last we must sit up and take notice of the overhead valve engines. Never will you hear such a wordy warfare as that which can arise when Mr. O.H.V. Jones twits Mr. Side-by-side Brown over the table with the remark that on the eve of the Show records are being mopped up by valve-in-head engines. Mr. Side-by-side bristles. Sprints, may be, says he, but his type alone can stand up to the long distances. Nonsense! what about the hour record? Mr. S.B.S. changes ground. Not a commercial job, expensive manufacture, wrecks engine when broken, noisy, operating mechanism losses counterbalance increased output; the whole hand laid on the table. Scorn of o.h.v. and supporters symmetrical lathe job on cylinder, not so expensive to make as imagined, old stick-in-the-mud 3% nickel side valves might break if used overhead, but new steels? Chromium! tungsten! Suppose old side-valve never heard of Stainless? Ideal combustion space; no distortion. Bound to maintain power indefinitely. Operating losses? Nonsense! Increased power output outweighs absolutely.

Mr. Side-by-side staggers up under this cudgelling. What about J.A.P.'s? "Proof of pudding," etc.; where's the o.h.v. to equal the new 250 c.c., 350 c.c., and 986 c.c.? What about the Norton? O.H.V. staggers; he remembers hazily a paragraph in a past issue of *The Motor Cycle*, and disposes of things thus: "Of course, you know that Nortons have an o.h.v. job behind the scenes? Straws in the wind, old boy, eh?" and Mr. Side-valve welcomes a mild journalist's interjection that he still thinks there's something to be said for the nearly-forgotten automatic inlet valve.

"—where angels fear to tread," says one, *sotto voce*. But what of it? The retrograde one talks of a.i.v. for touring engines; instances the 1909 P. and M. and the 1910 twin Rex (a pretty job), and points out the 1922 J.E.S. (produced by an engineer who

thinks progressively), talks of compound spring action for varied condition of high and low speeds, bounce snubbers for blow-back prevention, elimination of working and power using parts, economy of such engines, and so on; and eventually others think there's something left in the a.i.v.

Talk switches over. Are sidecars getting uglier? Signs of apoplexy from middle-aged coachwork specialists, and subject carefully steered by a diplomatic—or assertive—remark from one of God's own countrymen, "Gee, but I guess you've had to come right down to the Amurrican idea in chassis construction!"

A How? Why? chorus.

"Wal, there's a powerful tendency to join up your chassis to the frame by front connections low down. Guess the only connection above the hub level should be to the seat post, an' that don't wanner be rigid. Keep your front connections low down an' you have the right amount of flexibility between the bike and the chassis, an' cut out tube or lug fractures."

And to that little lecture a north country manufacturer, with no fancy for structures inherently flexible, mutters explosively, "Bah! Gi' me weight!"

Why not Winter Records.

Can records be made between December and early spring is another diverse topic rolled into the ball game of lunch table talk. Mr. Venturi Carb. assures everyone that the atmospheric conditions vary during this period of the year, and discourses on barometric pressures, temperatures, and humidity. All listen respectfully; who would not, when it is known that the speaker spends hours daily watching the interior workings of carburettors through glass induction pipes, and can tell you more about what happens round that corner in the valve port than you can about how your business is being run while you are up at the Show?

Mr. Carb. is in full flow, and people are trying to catch the waitresses's eye for the bill, when a young salesman (young enough to be seen and not heard) chips in, "You're right, Mr. Carb., records are quite out of the question at this time of the year—they closed Brooklands for repairs this week."

And so it goes on, day by day, *ad libitum*, as the Show progresses. Many times such topics as are raised bring light and knowledge even in the guise of persiflage; even if, as with most subjects of discussion, no definite conclusion is reached, yet the many minded views brought forward have a general tendency to increase and disseminate much floating knowledge, and the motor cycle movement benefits accordingly. Thus, even in such minor directions, does the Show justify itself.

WHARFEDALE.

A Small American Two-stroke.

Details of the 1922 Cleveland. A 2½ h.p. Machine with 3in. Tyres.

THE Cleveland motor bicycle is one of the few American lightweights, and has reached a high degree of popularity in the United States. Its layout is somewhat unconventional, yet it is very practical, as might be expected from a designer who subsequently evolved the American Ner-a-car, which in Anglicised form is familiar here.

The two-stroke engine (70×70 mm.=269 c.c.) is of the three-port type, with enclosed "outside" flywheel (the crank-shaft is of the overhang type). The drive, through a two-speed gear box, is transmitted through a worm gear to the final chain sprocket, a multiple disc clutch being housed in the worm wheel. A kick-starter is fitted. The magneto is situated at the rear of the unit, and is driven directly off the engine-shaft through a coupling.

Improvements.

The new features comprise a chain guard, which not only protects the chain from mud, but also the rider's clothing

An original feature on a lightweight is the inclusion of a dynamo as part of its equipment.

American two-stroke design—the 2½ h.p. Cleveland, fitted with two-speed gear and bevel and chain drive.

from contact with the chain, while valances have been added to the mudguards, and security from carburettor troubles has been ensured by means of an additional filter. An Amac carburettor is fitted.

Control Mechanism.

The clutch, following general American practice, is actuated by means of a lever on the near side of the machine, which first of all disengages the clutch, while a further movement applies the external contracting rear brake. The internal brake, also on the back wheel, is controlled by a pedal on the near side of the machine. The change of gear is effected by means of a heel-and-toe pedal adjacent to the off side footrest. Triumph

pattern spring forks of light but strong construction are employed.

In the case of the particular model we inspected, a lighting dynamo is bolted to one of the duplex frame tubes, and is driven by means of a V belt off the magneto-shaft, the battery case being accommodated behind the saddle tube. Petroil lubrication is employed, and 26×3in. tyres are fitted. The gross weight is 275 lb.

The weight, long wheelbase, and large tyres, in conjunction with the comparatively small engine capacity, are not conducive to high speeds, but the general comfort should approach the ideal.

The Cleveland machine is now handled in England by Shillan, Beck, and Co. (Inc.), 90, Cannon Street, E.C.4.

A Sporting Lightweight.

Well-known Track-man Introduces a Solo Mount to Bear his Name.

FEW vendors of motor bicycles have had wider riding experience than Mr. J. S. Holroyd, and to appeal to the young sporting rider he has placed a fast lightweight on the market bearing his own name. The motive power is a 250 c.c. J.A.P. engine fitted with an aluminium piston. Chain-cum-belt drive has been adopted, and the gear box is the new two-speed Burman, which incorporates a clutch.

Clean Outline.

The lines of the machine are symmetrical, and it is equipped with such well-known fittings as Druid forks, the new pattern Amac carburettor, a Webb front brake, and a rear brake acting on the exterior of the belt rim groove. Flat steel stays are employed in the attachment of the rear mudguard, and as the machine is intended chiefly for speed work, no luggage carrier is provided. The belt rim has been drilled for lightness, the rear hub is wide and substantial, and

A well-proportioned lightweight: the 2½ h.p. Holroyd sports model.

a full size touring saddle also forms part of the equipment. The machine is equipped with 26×2½ Hutchinson tyres and weighs 178 lb.

As far as possible, weight has been kept low, the crank case being below the

line of the hubs, and a racy appearance is given by the long exhaust pipe with its enlarged streamlined expansion chamber. The Holroyd motor bicycle is made by Holroyd Motors, 6, Warwick Street, Regent Street, London, W.1.

Two French Productions.

The 1922 Peugeot Models. A Two-speed Lightweight and a Motorised Bicycle.

THE only really late arrivals at the Show last week were the Peugeots, which did not materialise until the middle of the week. The two-stroke touring model is an excellent example of French motor cycle practice. It follows more or less standard lines, is of pleasing appearance, and should be capable of taking its rider anywhere. The engine is a two-stroke, 70×70 mm. (269 c.c.), and is termed $3\frac{1}{2}$ h.p. by its makers. The cylinder is inclined, and the radiating fins are paral-

As at the Paris Salon, the front wheel driven Peugeot bicycle attracted much interest at Olympia. The hub is supported on three small pinions, one of which transmits the power.

A new model by one of the best known French motor cycle manufacturers—a 269 c.c. two-stroke Peugeot. Observe the front fork design.

lel with the ground. The engine drives by chain to the countershaft, the chain being entirely enclosed; and from the countershaft to the back wheel the drive is by belt. The forks are pivoted at the crown, after the fashion of the Triumph; but the spring employed is of the quarter-elliptic multi-leaf variety anchored to the base of the steering column.

One feature of the machine is a large all-metal toolbox on the luggage-carrier, fastened with spring clips and a hasp and padlock. The machine is complete with kick-starter, clutch and two-speed gear, and weighs 154 lb.

The other Peugeot model is the Cyclo-moto, the engine of which is in the front

wheel. Like the larger model, it is a two-stroke, 45×58 mm. (92 c.c.), and is entirely self-contained with its drive. A magneto flywheel is fitted, which serves for both ignition and lighting, and the unit incorporates a Ferodo-lined disc clutch. The engine lies in the centre of the front hub, the inner side of which has an internally-toothed ring, and there are meshing with it three pinions, one of which is driven by the engine. All working parts are entirely enclosed, and the lubrication is on the petroil system. The front wheel and forks, which are of the spring variety, may be supplied with an attachment for fitting to an ordinary pedal cycle. It is said to be capable of averaging 18 m.p.h.

Motor Assistance for Bicycles.

The 1922 Auto-wheel. Now Imported from America. Increased Engine Size.

THE Auto-wheel was one of the earliest motor attachments for fitting to pedal cycles. It first saw the light in 1909, with a tiny two-stroke engine

as its motive power. It then assumed a practical form as a 1 h.p. four-stroke attachment driven by a chain through a countershaft, on which the Auto-wheel

itself was mounted, and enjoyed many years of prosperity until the war. Up to that time it was manufactured in Great Britain, but since the Armistice it

Auto-wheel details: crankshaft and integral small pinion, and the large pinion with four-point cam and oil pump eccentric. The two halves of the magneto flywheel are also shown.

The hub of the Auto-wheel is bolted to the exposed flange on the enclosed driving pinion. Observe the inlet valve dome and the stirrup fixing used.

Motor Assistance for Bicycles.—

has been found impossible to arrange for Auto-wheels to be turned out in this country, and it is at present being manufactured under licence in the United States, but in a different and improved form.

This attachment, which is handled here by Auto-Wheels, Ltd., Russell Road, West Kensington, London, W.14, now has a 2 h.p. engine, and, as before, is a four-stroke. The bore and stroke are 64×64 mm. (206 c.c.), and the automatic inlet valve is still retained. A flywheel

magneto is now fitted, and the lubrication, instead of being effected by the bird fountain system employed on the pre-war Auto-wheel, is by means of a simple form of plunger type pump, driven by an eccentric off the camshaft. This pump delivers oil through the bearings, and sprays it on to the connecting rod big end. The level of the oil is shown through a window at the base of the crank case, which forms a sump. Transmission is now by gear wheels instead of chain, and the small pinion on the crankshaft meshes with a pinion coupled

directly to the Auto-wheel itself. This gives a reduction of 8 to 1, and as the large wheel is mounted on the camshaft, a four-point cam is fitted.

The Auto-wheel attachment is fitted with a prop stand, and is pivoted to an arm attached between the rear spindle and bottom bracket of the bicycle, while there is an additional stay to the saddle tube. A single lever carburetter is fitted, the carburetter and exhaust lifter controls being by Bowden wire. The tyre size is 20×2in., and the weight of the complete attachment is 65 lb.

1922 British Standards.

Two Classes of Solo and Double-purpose Mounts Embodying Blackburne Engines.

BRITISH Standard Motors, of 4, Newtown Row, Birmingham, are next year making a bid for popularity by offering a two-speed 2½ h.p. Blackburne-engined lightweight at £65, or with clutch and kick-starter at £69. The machine is quite a good-looking mount, embodying such well-known components as Fellows magneto, Vici carburetter, Arden pressed steel forks, Dunlop tyres, Coventry chain, and Dunlop belt.

An Arden-engined two-stroke model, similarly equipped, will also be offered at £36 single gear, £42 with two-speed, and £46 with clutch and kick-starter. Better class machines with 2½ h.p. and 4 h.p. Blackburne engines will also be offered with two and three-speed gears.

First-class components are used in this *de luxe* model of the 2½ h.p. British Standard.

A NEW LEG GUARD.

ANYTHING that will tend to improve the motor cycle as a winter mount is of interest at the present time. Quite a large number of leg guards are now on the market, and it is becoming

A new design of Brandish leg shield that will fit most machines. This neat pattern is of dome sectioned pressed steel.

the rule for motor cyclists to fit them when winter approaches.

The Brandish guard, illustrated here, is worthy of special mention, owing to the neat method in which it is fitted and the fact that it is constructed of pressed steel, and therefore exceptionally strong. The fitting, which carries the transverse bars, is a simple split clip, through which passes a long rod having a tubular sleeve on each side of the clip. By the tightening of one of the nuts at the end of this rod, the whole of the fitting is rigidly bound together.

The cost per pair is 37s. 6d., and the makers are Brandish and Sons, Foleshill Road, Coventry.

It is not intended that this guard should replace the larger shield which this firm makes specially for Triumph machines, and which has been already referred to in these columns.

TO CLUB SECRETARIES.

"The Motor Cycle" Film is now being loaned to enterprising clubs which are keen to make their winter social events a success. This exclusive film takes about forty minutes to exhibit, and the programme includes scenes at the Junior and Senior T.T. Races, the 500 Miles Race, the Six Days Trials, the Grand Prix Car Race, and the 200 Mile Small Car Race. Club secretaries should write to the Editor (Film Department), "The Motor Cycle," Coventry, suggesting two or three alternative dates, preferably in April or later in 1922.

THE INTERNATIONAL SIX DAYS TRIAL.

AT three o'clock on Friday afternoon last, M. Jules Neher attended the A.C.U. rooms at Olympia with the medals and certificates won in the International Six Days Trial by the principal English competitors. Mr. Neher was introduced by Mr. T. W. Loughborough, Secretary of the F.I.C.M.

Mr. Neher, in a short speech before the presentation, made some remarks concerning next year's International Six Days, and said that the route would be altered, and there would be one day's rest at Lugano. On that day there would be a hill-climb, in which competitors might either take part or act as spectators. It was over a very sensational course, upon which high speeds have been attained. Réverting to this year's International Six Days Trial, Mr. Neher specially congratulated Eric Williams on his wonderful performance with a 350 c.c. engine (a 2½ h.p. A.J.S.), which had since become world-famous.

Other competitors present were E. H. Lees, J. A. Newman, E. P. Dickson, and Hugh Gibson. Unfortunately H. Langman, C. P. Wood, and E. Poznanski were unable to be there.

The medals were actually presented by Mrs. T. W. Loughborough. At the conclusion of the little gathering, Mr. Loughborough thanked M. Neher for the excellent organisation of the trial, which was an event run on the Continent in which British manufacturers could have complete confidence.

PROGRESS OF OUR OLDEST CLUB.

A New President announced at the Fifteenth Annual Dinner of the M.C.C.

ON the occasion of the fifteenth annual dinner of the Motor Cycling Club last Thursday evening, the fine banqueting hall in the Wharfedale Rooms at the Great Eastern Hotel was remarkably full.

Naturally among the guests were the representatives of the clubs which distinguished themselves in the M.C.C. Team Trial for *The Motor Cycle Cup*, and the Sheffield and Hallamshire championship team of 1921 was complete with its president. The chair at the dinner was occupied by the president of the M.C.C., Colonel Charles Jarrott, O.B.E., who occupied that position for the last time, for it was announced later in the evening that Mr. J. K. Starley, of Coventry, is the president elect, which news was received with acclamation.

Ever-growing Membership.

The duty devolved upon Colonel Jarrott of proposing the toast of "The Club." He reminded those present of that excellent motto for speakers, "To stand up, to speak up, and to shut up," so he said he would be brief. Most of his audience knew the club's history. The club was to be congratulated on its excellent committee, upon the individual members of that committee, and upon its chairman and secretary. He dwelt upon the importance of the club events, which took a high place in the sporting side of motoring. He was referring to such events as the London-Edinburgh and the London-Exeter runs, which were held in the winter time. In 1915 there were 250 members; at the end of the war there were 500; and at the present time the membership was double that number. In 1905 the bank balance was £200, and he wondered if he were giving away secrets when he said that a suggestion had been made that a Rolls-Royce car should be bought for the members of the committee with the present bank balance.

He sincerely hoped he was not giving away the committee's secrets in referring to this matter. (Laughter.) He congratulated the Sheffield and Hallamshire Club on its success in the annual club team championship, and predicted another hard fight next year.

Next followed the presentation of the trophies, *The Motor Cycle Cup* being received by Mr. S. Sawyer, captain of the winning team.

Mr. R. H. Head, chairman of the committee, proposed the toast of "The President," who was a founder member, and had presided over the club since 1908.

Colonel Jarrott, in reply, said he owed a deep debt of gratitude to the old brigade, and thanked all who had helped him in the past.

Mr. Head then rose to state that Mr. J. K. Starley had been invited to be the club's new president, subject to his election at the next annual general meeting.

Mr. J. K. Starley, replying, said the motor trade stood alone, in that every problem connected with it was more closely associated with sport than any other industry, and he was quite sure that in its early days Colonel Jarrott and other pioneers had introduced a sporting feeling which had lasted up to the present time. The Motor Cycling Club was one of the most sporting clubs, and he hoped that it would be as kind to him at the end of his term of office as it had been to the late president. Mr. Starley then went on to propose in a witty speech the toast of "The Visitors," making special mention of Messrs. Geoffrey Smith and E. M. P. Boileau, representing *The Motor Cycle*, which, in his opinion, was the greatest technical organ ever produced. He would like to mention, among the distinguished guests present, Colonel Brereton (chairman of the Auto-Cycle Union), Mr. T. W. Loughborough

(its secretary), and Mr. Stenson Cooke (who wanted everybody to join his army for one guinea, and be saluted from Land's End to John-o'-Groat's). (Laughter.)

Mr. E. M. P. Boileau recalled his eighteen years' association with the Motor Cycling Club, his first duty being in connection with the S. F. Edge Hundred Miles Trial, an event which taught a great lesson, viz., how difficult it was to find a winner, and one which had not been properly solved until the present day.

London-Exeter Sportsmanship.

Mr. Geoffrey Smith thanked Mr. Starley on behalf of the visitors, though he disclaimed that he was a visitor, and referred to the sporting character of the long distance trials organised by the club, and to the London-Exeter run in particular, expressing admiration for all those great sportsmen who, swathed in mackintoshes and overalls, braved the terrors of that arduous winter competition.

Mr. Stenson Cooke, in an amusing and characteristic speech, said Mr. Starley had inferred he had come to the dinner to get members for the Automobile Association. It was quite true, but he did not like it rubbed in. "But there you are," he said. (Cheers and laughter.)

Thereafter followed a musical entertainment, for the organisation of which Mr. E. Bridgman was highly to be congratulated. It is difficult to differentiate between such a gathering of artistes, but special mention of the great Coram, the ventriloquist, must be made. With his figure, Jerry, Coram carried on an animated and topical conversation relating to front-driven Werners, Quadrants with surface carburettors, and other items which greatly amused and entertained the company.

B.M.C.R.C. DINNER.

International Character of Brooklands' Habitues' Social Function. £603 in Awards Last Year.

PLENTY of fun, an excellent musical entertainment, and the distribution of numerous prizes were the principal features of the British Motor Cycle Racing Club's dinner, held at the Holborn Restaurant on the evening of the 28th ult. There was a total absence of formality about the whole affair, there were few speeches, and the rest of the evening was devoted to the distribution of the numerous prizes, which were of the total value of £603, thirty-three of which were presented by various donors. The entire inside of the folder enclosing the menu and programme was devoted to a list of various awards gained by members of the club during the past season. As last year, the dinner assumed an almost international character.

The Chairman.

The chairman was Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S., who at the close

of the dinner proposed the toast of the King, which was followed by an excellent speech by Mr. H. T. Rutter, proposing the Club.

Early Racing History.

Mr. A. G. Reynolds, one of the founders of the club, in reply, welcomed the British and foreign visitors. At the time the club was founded, in 1909, motor cycles were not wanted at Brooklands. Their place was then Canning Town. In those days there were few motor cycles and few riders. It was the B.M.C.R.C. which had discovered the value of the fork for racing purposes, where the start, finish, and the whole of the race was directly under the eyes of the spectators. He had to express his thanks to Captain Miller for the success of the 500 Miles Race.

Then followed the presentation of prizes, which occupied a considerable

time, and culminated in scenes of great enthusiasm when Le Vack received the Miller gold cup value £200, and was carried off shoulder high. On the occasion of the presentation, Mr. T. W. Loughborough said that Mr. W. H. Wells had given the prize, which he, as entrant, had won to Le Vack, the rider, an announcement which was followed by hearty cheers. Le Vack was called upon to reply, and in a very short but charming speech said that his success was chiefly due to that lone Britisher in the U.S.A., C. B. Franklin, whom older members would remember.

Not Too Old at Forty.

During the dinner it was announced that D. R. O'Donovan had agreed to present a twenty-guinea cup, to be competed for by members over forty years of age. The conditions of the event will be announced at a later date.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

REPLACING A MAGNETO.

Having a 1909 $3\frac{1}{2}$ h.p. single-cylinder Triumph motor cycle which requires a new magneto, as the old one is beyond repairing, I understand that if I got any type of single-cylinder magneto with the same kind of sprocket in every way it would be as required. Is this so?—W.M.

We are rather at a loss to understand your query. Any single-cylinder magneto will suit the machine provided it is arranged to run in the same direction as the one which has been removed, and is provided with a sprocket of the same size as that on the exhaust cam wheel-shaft of the engine.

BROOKLANDS ASPIRATIONS.

A 1914 Triumph single-cylinder motor cycle which I ride does about 65 m.p.h. on the road on a $4\frac{1}{2}$ to 1 gear. It is perfectly satisfactory as regards hill-climbing and power, and I wondered if it was tuned up and a new exhaust system fitted whether it would stand a chance of winning a race at Brooklands this year. What is the entrance fee to race there? Would an aluminium piston and a racing carburetter improve the speed, with, of course, modified cams? I have raced most things on the road, cars included, and also am acquainted with an old Brooklands man who would assist me, but, of course, I do not want to trouble unless there is a sporting chance of winning.—G.R.

If your machine actually does 65 m.p.h., you might stand a sporting chance of winning some of the handicap events at Brooklands. You may find, however, that the 65 m.p.h. which you do on the road comes a very long way short of 65 m.p.h. which is obtained against the electrical timing apparatus on Brooklands, and we should advise you to try your machine out over a measured mile against timing by two very accurate and conscientious timekeepers. You will have to go through a good deal of experimenting, and it is impossible to say that an aluminium piston and racing carburetter would improve matters to any great extent. Neither does it follow that a modified timing is necessary. The secretary of the British Motor Cycling Racing Club, the Millhouse, Warrington, will give you information regarding entrance fees for the Brooklands races.

TYRES FOR PILLION RIDING.

(1.) Do you consider a $26 \times 2\frac{1}{2}$ in. Dunlop heavy tyre strong enough for occasional pillion riding? (2.) Can a $26 \times 2\frac{1}{2}$ in. tyre be fitted to a $26 \times 2\frac{1}{2}$ in. rim, and, if so, do you recommend it? I am rather nervous of an oversize cover blowing off the rim.—R.H.A.

(1.) The tyre is not of large enough section for pillion riding with safety and comfort. (2.) $26 \times 2\frac{1}{2}$ in., $26 \times 2\frac{1}{2}$ in., or $26 \times 2\frac{1}{2}$ in. for 24 in. will fit the same rim. There should be no fear of any of them coming off provided they are properly fitted and fairly well inflated.

MAKING A WIND WAGGON.

(1.) I am building a light cycle car, and wish to know if it would be possible to have a 5 ft. 6 in. propeller, four-bladed, driven by an 8 h.p. J.A.P. engine. (2.) Could I obtain satisfactory results from it, and what m.p.h. would be possible? (3.) Would it be satisfactory to run the propeller at engine speed; if not, what gear ratio should I employ?—L.B.

(1.) The machine which you propose building would probably be quite satisfactory on the level, but it is very doubtful if it would climb hills well. You will need a propeller specially designed to suit the power and speed of the engine in use, and you should submit particulars of the engine, normal revolutions, and h.p. to the propeller makers. (2.) It is impossible to tell you what m.p.h. you could obtain, as everything depends upon the design of the car and the effici-

ency of the propeller. (3.) With a high speed engine, it might be necessary to run the engine much faster than the propeller, but the propeller makers would give you information on this point.

EXCESSIVE FOUR-STROKING.

Over 1,000 miles, with the engine running faultlessly, have been covered by my Villiers two-stroke engine, but recently it has developed persistent four-stroking on the level and when under light load, irrespective of the throttle opening. Under load and up hill it two-strokes with perfect regularity. The trouble seemed to occur when I tried Aviation spirit, so I fitted one jet smaller, a 24 Amac, thinking the mixture too rich. This was of no avail, so I returned to No. 1 spirit, still using the No. 24 jet. The engine is not over-oiled, but has not yet been decarbonised. (1.) Would the trouble be due to having too weak a mixture? (2.) Why should the engine four-stroke when Aviation spirit is used? (3.) Would the carburetter want cleaning or the engine decarbonising? (4.) What remedy, if any, can be given?—E.A.M.

You do not give sufficient details for us to diagnose the trouble. (1.) It is unlikely that the trouble would be caused by a too weak mixture. (2.) Four-stroking is usually caused by the mixture being too rich. (3 and 4.) Possibly the engine needs decarbonising; but we should suspect that the carburetter is flooding, due either to the needle valve being worn in its seating, or to the float being weighted down with petrol owing to a leak. Verify this by removal and shaking.

THE SIMPLEST PASSENGER MACHINE AT LAST WEEK'S SHOW. Wood and wickerwork enter largely into the construction of the Economic three-wheeler, which is friction-driven by a small flat twin two-stroke.

*Olympia has introduced to you all the latest models—
Godfreys can supply them.*

Should your difficulty be the disposal of your present machine—Godfreys will take it off your hands in part exchange, provided it is modern, and in good condition.

Perhaps another difficulty is that your money is locked up, and it would not suit you to realise in order to pay cash for a new machine—Godfreys Credit Payment Scheme meets this difficulty :—

4% only is added to the purchase price (except in those cases where higher rates are fixed by manufacturers). One quarter of the amount is required as deposit and—the balance is payable in 12 equal monthly instalments.

In all cases you deal direct with Godfreys.

The Easting Windscreen makes an irresistible appeal to the rider who cares for greater speed.

Mr. D. S. Heather, B.Sc., A.M.I.A.E., in an independent report of extensive scientific tests on wind resistance, proves that an Easting windscreen set in the normal position, does not in any way retard the speed of the combination—but—through its streamlining qualities when in the "Full-out" position, it actually increases the speed.

This is but one of the qualities of the 'Easting' it affords entire protection from Rain, Snow, Wind, and Dust—and makes the sidecar as cosy as an enclosed car.

Try the SHALER way

It's perfectly simple—anyone can produce a clean, firm, permanent tube repair at the first attempt. No expert knowledge of vulcanising is needed—and the resultant repair becomes part of the tube itself. The

SHALER

Five-Minute
Vulcaniser

is used with perfect success by more than a million motorists all over the world. Use the Shaler, and save time, trouble, and money.

A NEW BELT ADJUSTER

possessing UNRIVALLED ADVANTAGES

1. It enables you to shorten or lengthen the belt in a moment.
2. This is done by a turn or two of the centre piece.
3. This single action gives you a most efficient adjustment under all circumstances.

THE IMPORTANT POINT

to remember about the "FORBES" is that it is an ADJUSTER, not merely a fastener.

If your local Motor Trader does not stock it, write to the Distributing Agent for your District for name of the nearest Stockist.

MEND YOUR PUNCTURES WHILE YOU RIDE

JACKSON'S IMPERVO is a puncture preventive that automatically seals punctures while you ride, and prolongs the life of tube and tyre.

It is a pressure-resisting liquid, occupying only 5% of the air space of the tube and cannot solidify or affect resiliency. Jackson's Impervo does away with all trouble arising from sticky patches and messy solutions. It is extremely simple in use, maintains proper inflation, does not prevent vulcanisation, and eliminates bursts.

It is an inestimable boon to the cyclist who desires more mileage for his tyres, with a minimum of trouble and expense. Our illustrated booklet will tell you just what Jackson's Impervo means to you. Write us to-day.

We Guarantee Satisfaction.

"COULSON"

Justifies its claims.

Scores of people every day during the Show last week were astonished at the springiness and superlative comfort of the Coulson. Many could not believe that such comfort could be made possible on a motor cycle.

The leaf-sprung saddle pinion—a method of frame suspension exclusive to the Coulson—was a revelation to a crowd of interested onlookers; experts characterised it as something so absolutely revolutionary that it will irrevocably banish the 'rigid' frame.

A rider on a brand new 1922 Coulson will be the envy of those who, not having heard about the superior merits of this motor cycle 'leaf-sprung like the limousine' have purchased the ordinary 'rigid-frame' mount. The comfort of a Coulson is so pronounced—the easy manner in which it floats over the worst of potholes is so obvious—that onlookers cannot fail to notice it.

Get a "Coulson" and experience the joy of having the mount which everybody wishes he had bought—when he rides on it.

The Coulson is made by A. W. Wall, Ltd., of Tyseley, Birmingham—the motor cycle makers with the longest experience—and is fitted with a 'Blackburne' engine, the power unit with the classic reputation.

CLAYRITE

One of the Clayrite series, fitted with the new mechanism, a masterpiece of simplicity and reliability. There are only two moving parts, there are no bearings or pivots to wear and rattle, and one self-locking screw controls the tone and compensates for ultimate wear. It consumes very little current, and is supplied in black and nickel, or nickel-plated finish, and for 4 or 6 volt current.

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

AND GEAR COMBINED.

Philipson's Latest!

GOVERNOR PULLEY AND VARIABLE GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines.

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

2-stroke.

LEVIS, O.K., CALTHORPE, VILLIERS, etc.

4-stroke.

TRIONPH, NORTON, ROVER, SINGER, COULSON, BLACKBURN.

We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.

Our Flywheel Governor converts a single-speed 2-stroke into a speed model—the lightest speed model on the market!

THE ONLY GEAR WITH NO END THRUST.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet.

No gear box friction.
No grinding noises.
No wheels or pinions to chew up.

Are you still in doubt?

The Motor Cycle Show at Olympia may have assisted a good many motor cyclists in their choice of a mount for next season. But thousands of intending purchasers left the exhibition more perplexed than when they entered it. If you are numbered among them, please avail yourself of our experience—we can supply any machine of good make, so that you can depend upon our recommendation being unbiassed.

No matter if you need a mount to ride yourself, or for presentation as a Christmas Gift—get it at TAYLOR'S, where you are sure of a square deal.

Our stock includes motor cycles ranging in price from 38 to 200 guineas, and three or four wheel cars from £150 upwards. The payment may be cash, or out of income, and extended over two Christmases.

The following is a selection from our varied stock—may we send you Catalogue descriptive of any particular machine?

RELIANCE Magneto Repairing Co. for repairs and new magnetos.—See below.

RELIANCE guarantee to return your magneto within 3 days, and if necessary 24 hours, with a written guarantee for 12 months.

RELIANCE test every magneto after repair under all running conditions, and, as we contract for many of the largest concerns, you need have no hesitation in placing your repairs and orders with us.

RELIANCE manufacture and stock spares for Thomson-Bennett, E.I.C., Splittorf, U.H., Bosch, Dixie, etc.; special line genuine platinum screws for every make, 12/ per pair.

RELIANCE will be pleased to give advice free of charge upon any question concerning ignition troubles, as we place our long-standing experience at your disposal, and old and new customers may be certain of getting the usual promptness and courtesy that we have always endeavoured to give.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1.

RELIANCE Magneto Repairing Co., 28, St. John St., E.C.1., for new and second-hand magnetos.—See below.

THOMSON-BENNETT Magnetos, new and unused, single-cyl., clock or anti, suit any machine, price 55/-; twins, 45, 48, 50, 55, 60, 180 degrees, for J.A.P., Clyno, Douglas, etc., price 55/-. See our guarantee.—Below.

C.A.V. Magnetos, new, single-cyl. and 180° twins, clock or anti, ideal for Douglas, Levis, Calhoun, O.K., or any lightweight; these magnetos are of the finest workmanship throughout; price 55/-. See our guarantee.—Below.

BOSCH D.A.L. Magnetos, soiled only, otherwise as new, single-cyl., suitable for any stationary engine or big single, £3/15; twins, any degree, ready to drop on Indian, Harley, or any big twin, £4/5; a powerful spark at low speed, ensuring easy starting. All the above magnetos are variable ignition and fitted short-circuiting switch. See our guarantee.—Below.

GUARANTEE—Every magneto that leaves our works, no matter what the price or make, carries a written guarantee. Not merely a guarantee that same is in good order at time of sale, but a plainly written statement that we guarantee every machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors.

RELIANCE Magneto Repairing Co. hold one of the largest stocks in London, and can be depended upon for a straight deal at the right price. When buying it pays to deal with a firm of repute.

RELIANCE cordially invite customers to their works to see any of the above on test. Magneto list giving full particulars sent upon application.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1. [6616]

**A Right Choice—
may we help?**

THE variety of machines—lightweight, medium-weight, heavyweight, solo, or sidecar—is now so extensive as to be almost bewildering; and if you haven't a great deal of experience with motor cycles, it is difficult to make up your mind as to the mount you ought to buy.

Too many motor cyclists are apt to get over this difficulty by making a more or less haphazard selection, without proper guidance—and the result is that, for lack of impartial, expert advice at the time of making their purchase, they fail to get either the pleasure, the service, or the value that they should get.

For everyone there is a "best possible" machine, varying with his personality, his needs, the district in which he lives, and—of course—the sum he wishes to spend. We want to help you to obtain that "best possible" motor cycle, and, therefore, we ask you to do what so many are doing every day—to write to us.

Our disinterested advice is always at your disposal, and our Mr. Tollady will be happy to give you the benefit of his 25 years of riding and technical experience with motor cycles and motor cycling. We hope his assistance may prove valuable to you; at all events you are welcome to it, without cost or obligation.

We are offering for the 1922 season, among other machines:

ARIEL, B.S.A., DIAMOND, DOUGLAS, EDMUND, ENFIELD, HUMBER, INDIAN, MASSEY-ARRAN, MATCHLESS, NORTON, RUDGE, SCOTT, SUNBEAM, TRIUMPH, and VELOCETTE Motor Cycles; also ROVER, BELSIZ-Bradshaw and CROUCH Light Cars.

In addition, we have an exceptional stock of bargain machines, all in splendid running order, sold with our guarantee. We will make an exchange with pleasure, if you wish, or will supply on any reasonable proposal of extended payments, to suit your convenience.

**J. W. TOLLADY,
General Manager.**

H.G.T.

WANTED.

WANTED to Purchase Outright for cash, bankrupt stocks. W.D. spares, miscellaneous spares. Send full particulars.—McNelle and Platt, 57, Gt. George St., Liverpool. 'Phone: 1092 Royal. [2486]

Leave it to the "Best"

WHY not forget all about your lubrication and leave it to the

BEST

AUTOMATIC OIL PUMP

Less Oil—Better Running

One user says—"It is the cheapest and most useful accessory I have purchased in 15 years of motor cycling."

It costs only 25/6—plus cost of fitting. It cuts down oil bill 30% to 50% and provides perfect lubrication with its attendant advantages.

The Patentees, Sole Makers, and Guarantors are—

Armstrong and Sturmev-Archer

— GEARS —
REPAIRED IMMEDIATELY

We make a speciality of prompt and efficient REPAIRS, and GUARANTEE that when a Gear leaves our works it is in perfect order, so, if in trouble with your Gear, it is to your own interest to send it direct to us. This is the most satisfactory method and quickest, for we submit quotation same day, and repair immediately on receipt of instructions. If quotation not accepted, no charge.

REMEMBER.

We undertake to repair your gear while you or your messenger waits.

WHEN SENDING REPAIRS:

1. It is advisable to send complete wheels to Hounslow, L. & S.W. Rly.
2. A letter advising as to date of dispatch, station sent from, and mark and number of hub should be posted, and, MOST IMPORTANT, two labels bearing sender's name and address on reverse of both should be tied to the wheel.

Station for Callers—Heston-Hounslow District Rly.

TOOL Rolls, strong leather, with strap and pockets, 7x18in. 3/-; other sizes made—Below.

LEATHER Knee Grips with oval pads, 5/6 pair, carriage paid; cash refunded not approved—Below.

LEATHER Leggings to measure; illustrated list and instructions free from makers—County Legging Co., Franchise St., Perry Barr, Birmingham. [9040]

"An all-round Man, but——"

"You're right, old man, but I happen to know that, in spite of it, he's out of a billet. He's a fair salesman, has a smattering of languages, knows a bit about clerical work, and one or two other things, but doesn't really 'shine' at any one thing.

Qualifications like that aren't good enough to-day. The man who wishes to get on *must* specialise. Take Jack Smith, for instance. Went back to his old job as a clerk after the war—now he's getting £600 a year as Accountant to an Engineering firm.

How did he do it? In the same way as I did—took a course of Postal Tuition under Wolsey Hall. He went in for Accountancy while I chose Secretarial work. We sat for our Final Exams. the same week.

Why don't you take up something like that this winter? It not only 'bucks you up' all round, but it's the quickest way to promotion. Try it!"

SADDLES, Brooks B170, as new; 22/-, post free.—Gosford Engineering, Ltd., Coventry. [X3403]

CHAINS, Renolds 5/8x3/16, 96 links 19/-, 56 links 11/-.—Lancaster, Heeley Rd., Birmingham. [X3314]

SOUND 3-speed Armstrong Wheel, complete; £7, or offer.—Blackburn, High St., Coatham, Redcar. [1349]

DISSOLVED Acetylene Cylinder, 6ft.: £11/10, cost £3/10.—West Cottage, Enmer Green, Reading. [1383]

P and M. Engines, frames, and practically any part at low prices.—1, Bellingham Terrace, Catford. [1400]

MOTOR Cycle, complete less power unit; bargain, £8/10.—A. Fogden, Hunston Dairy, Chichester. [1479]

P and M. Cylinder, perfect, 30/-; lightweight Amac carburettor, as new, 20/-.—170, Red Lane, Coventry. [X3349]

ARMSTRONG 3-speed Clutch Wheel, all controls, guaranteed good order; £9.—18, Key Hill, Birmingham. [X3346]

BOWDEN Gear, 2-speed, kick start, splendid condition; nearest £10.—Brickell, St. Martin's, Portland. [1602]

STURMEY-ARCHER 3-speed Clutch K.S. Gear Box, practically new; £11.—42, Beechill Rd., Eltham. [1361]

P and M.—Incomplete machines, £17/10; 1918 machines, renovated as new, £50, guaranteed.—Below.

P and M.—Engines, £8/10; gears, £5; forks, £3/10; tanks, 15/-; wheels, 35/- pair; handle-bars, 15/-.—Below.

P and M.—New goods: Magnetos, 50/-; magneto chain case, 5/6; chain cases, 32/6; saddles, 25/-; valves, 1/-; piston rings, 1/-; bushes, 1/-; drip feeds, 19/6; rames, 25/-; footrest rubbers, 2/- pair.—Below.

P and M.—New tyres, 17/6. All parts stocked; prompt delivery. Enquiries, stamp please.—Below.

P and M.—The specialist and agent: Lewis M. Inman, Durham Rd., Seaforth, Liverpool. 'Phone: Waterloo 296. [1248]

HEDSTROM Carburettor, off 7-9h.p. Indian, perfect order; 14/6, quick sale.—Box 7,688, c/o The Motor Cycle. (D) [1265]

GEAR Box, 3-speed and clutch, latest type, practically new; price £12/10.—Sinclair, 32, Charing Cross, S.W. [9009]

SEND for our Helmet and Tyre Price List.—Emanuel and Co., Tyre Factors, 37a, Balls Pond Rd., Dalston, N.1. [0738]

CARBURETTOR, Amac, 1920, 1/2in. induction, 35/-; control wires, 3/6 set.—Lancaster, Heeley Rd., Birmingham. [X3316]

BOWDEN Inner Wires, 1-16in., 1/4d. foot; outer 3d.; postage extra.—Llange, 79, Waverley Rd., Redlands, Bristol. [1776]

CLYNO Spares.—Everything to be cleared at cost. Write Ex-soldier Llange, 79, Waverley Rd., Redlands, Bristol. [1777]

STURMEY-ARCHER Gear Box, brand new, makers' case; £16, bargain; approval, cash.—Sanguinetti, Egerton, Kent. [1150]

NUTS.—Bags 8 gross, assorted, 10/- per bag. Tools, large quantities, cheap.—Crown Garage, Thames St., Weybridge. [1452]

JARDINE Gear Box and Back Stays, complete; 49/6; owner fitted Sturmeys.—Lockhart, East Markham, Newark. [1285]

PARTS AND ACCESSORIES.

COPPER Exhaust Pipe, polished, all sizes stocked, straight, from 2/3 ft.; bending a speciality.—Evans.

TRIUMPH Pipes, special offer, complete with clip; long copper 14/6, steel 13/-, plated 18/-.—Evans.

DOUGLAS, 2 1/2 h.p.; copper 12/6 pair, steel 10/-, plated 17/6.—Evans.

RUDGE, Sunbeam, Rover, Norton, copper 20/-, steel 16/-; New Imperial, Omega, Levis, etc., copper 14/-, steel 10/6; all T.T. bends.—Evans.

MUFFLER Ends (Norton pattern), detachable, fish-tailed, to suit above, various sizes stocked, from 2/6.—Evans.

FOOTBOARDS, solid aluminium, uncurred front and heel piece, with adjustable clips, 15/- pair; with fittings for Douglas, 15/-; for Triumph, 16/-.—Evans.

WHEELS from 42/- pair; specials built to order; any parts supplied.—Evans.

TOOL Boxes, armoured, suit Triumph, etc., 10/9 pair; with locks, 13/- pair.—Evans.

HANDLE-BARS, plated, Triumph pattern, W.D. or D.R., 1/2in. 14/-, 1in. 15/-.—Evans.

LEGSHIELDS, suit all machines, enamelled and gold lined, complete, 13/6 pair; aluminium, 15/- pair.—Evans.

BELT Rims, any size to order, 16/6; spring forks from 60/-.—Evans.

TAN-SAD Pillion Seats, brand new, to clear, 29/6 each.

CARRIAGE Free, cash with order, discount to trade.—Evans Bros., Brougham St., Hockley, Birmingham. [X3578]

CELLULOSE Sheets, 50x20 15/-, 25x20 8/6, 20x12 1/2 4/9.—Henry Jones, 778, High Rd., Tottenham, London. [9375]

SPEEDOMETERS, bargains.—250 Jones trip model, 70/-; trade supplied.—Pioneer, 211, Shaftesbury Av., London, W.C. [9183]

COMPLETE Front Brake, 7/6; touring handle-bar, 7/6; Triumph carburettor, complete, £1.—Aberlyn, Southminster. [1179]

150 SCREWS, nuts, washers, set screws, 3/-; 144 bright steel bolts, 2/6; 72 bright hexagon nuts, 2/6.—See below.

72 BEST Spring Washers, 3-16in. to 1/2in., 1/9; 36 castle nuts, 1/2in. to 1 1/2in., 1/9.—See below.

144 Coppered Bifurcated Rivets, 8d.; 12 8in. Backsaw blades, 1/6; any of the above carriage paid.—Wood, Tithebarn St., Preston. [X2924]

ALUMINIUM, cast iron, and steel piston manufacturer; any pattern.—W. Cole, 53, Sarehole Rd., Sparkhill, Birmingham. [X3399]

DRUID Forks, suit 3 1/2 h.p., 55/-; extra heavy pair, suit 6 or 8 h.p., 75/-, equal to new.—56, Sutton St., Aston, Birmingham. [X3309]

BINKS Carburettor, brand new, with spare jets, key, and Bowden controls, never fitted; £3/10.—Crockham, York Rd., Eastbourne. [1289]

CYLINDERS.—J.A.P. 2 1/2 h.p., 30/-; 6h.p. front, 35/-; 8h.p. back, 35/-; B.S.A. 4 1/2 h.p., £2.—Lancaster, Heeley Rd., Birmingham. [X3315]

RENOLDS Chains, 3/8x1/4in., 96 links 20/-, 56 links 12/-; soiled but unused; approval.—56, Sutton St., Aston, Birmingham. [X3308]

CROWN Adjustable Pulleys, Triumph, B.S.A., Premier, Precision, Hummer, Bradbury, 17/6; J.A.P.'s, 19/6; Douglas, 25/-.—Ridington.

MAGNETO Sprockets, 7-tooth to 24-tooth; engine, hub, and chain sprocket manufacturers.—Ridington.

LIGHTER Plints, 11d. doz., 2/- 3 doz., 5/6 gross.—Ridington, 202-4, Southampton St., Camberwell. [9459]

N.S.U. Gears, fit Triumph, Bradbury, N.S.U., Rover, White and Poppe, and others; £5/10; approval.—Box 7,709, c/o The Motor Cycle. [1694]

PALMER'S Motor Auction, every Thursday, 2 o'clock. Send those parts and accessories. Selling commission 10%.—Palmer's Garage, Tooting. [1738]

100 SADDLES.—Brooks B170, 30/-; Lycett, large 25/-; as new; satisfaction or money refunded.—Turner, 78, Church Rd., Willesden. [8554]

SPEEDOMETERS complete from 45/-; guaranteed; repairs executed.—J. W. Robins, Speedometer Specialist, 97, Latchmere Rd., Battersea. [9661]

CLYNO Spares.—For parts all models, lowest prices and quickest despatch, write Claridge's Clyno House, 8, Chandos Rd., Redland, Bristol. [1260]

COWEY Speedometer, complete, 26in., perfect, 35/-; new Macintosh tyre, heavy, 26x2 1/2; 15/-; Triumph plated bars, 6/-.—177, Earlsfield Rd., Wandsworth, [1286]

WATFORD Speedometer, in perfect order, complete, with trip, best offer over 25/-; also pair E.L.I. mudshields, bargain, 7/6.—J. P. Whitehead, Appley. [1220]

PARTS AND ACCESSORIES.

2½ h.p. 2-stroke Engine and magneto, £4; 1920 Enfield gear spindle, as new, 6/-; large Amac carburetter, 15/-—C. 686, Garratt Lane, Tooting, S.W.17. [1448]

ARMSTRONG 3-speed Hub and Wheel, clutch, belt drive, perfect order; £8, or nearest; also Triumph and Chater-Lea frames.—Sherwood, Sandy's St., Newry. [1310]

N.S.U. off Triumph, £5; exchange for N.S.U. processed for Ariel; Armstrong 3-speed, as new, £7.—Taylor, Brownlow Cottage, Pleasington, Blackburn. [X3365]

INDIAN 7-9 h.p. Kick-start Attachment for 2-speed models, double ratchet on ball bearings; 60/-—Particulars, Hopkins, 283, Foleshill Rd., Coventry. [X3360]

GAUNTLET Mitts, lined, suitable for motorists, at the astonishing figure of 2/- per pair, 8d. postage.—D. and S. Autocar Co., 33, The Parade, Golders Green. [9924]

BURMAN Gear, new, 2-speed, clutch, K.S., gate change, £7/10; Enfield gear and engine sprockets, perfect, £3/10.—Wagstaff, 87, Lordsmill St., Chesterfield. [X3368]

P. and M.'s—Cast aluminium polished gear covers, with loose caps, 22/6; back guard, 6/6; magneto covers and back, 4/6; footboards, 10/6, postage extra.—Below.

NUMBER Plates, cast aluminium, silver polished letters and border, any number; cycle 10/6, car size 15/6.—Towler, Thorn St., Burnley. [1306]

LONG Exhaust Pipes, direct from engine, in copper or nickel-plated steel, for all make of machines; standard sets, with detachable mufflers, from 21/-.—Below.

DISCS, in polished aluminium or light steel, from 15/- per wheel; leg shields, in polished aluminium or light steel, from 17/6 per wheel.—Mersey Disc Co., 34, Sutton St., Warrington. [1165]

LIGHT Car Front Axles, tubular section, 4ft. track, fitted with swivel heads, steering arms, and track rod; 25/-; stamp reply.—West, 80, Maldon Rd., Acton, W.3. [9081]

ARIEL 3½ h.p. Single Speed Frame, saddle, wheels, tyres, mudguards, handle-bars, and carburetter, etc. (everything except engine); offers.—25, St. Alban's Rd., Smethwick. [1233]

STURMEY-ARCHER 3-speed Gear, heavy, with clutch and kick start, countershaft, brand new; approval, £14, deposit.—1, Meadow View, Newbridge, Wolverhampton. [1272]

CHAINS.—Reynolds new Enfield rear, 22/-; P. and M. rear, 20/-; Clyno rear, 17/6; Clyno front, 12/6; Triumph front, 11/-; 2¼ Douglas, 10/-; stamp enquiries.—Snow.

SUNBEAM Gears, etc., new, cheap; Clyno ammunition carrier, complete, £5; Bowden carburetter levers, new, 7/6; Cowey trip speedometer, new, £3/17/6; approval.—Snow, Laurel St., Dalston, E.8. [1747]

MOTOR Cycle, everything, less power unit, good tyres, Druids, dropped frame, drip feed, carrier, brakes, bars, etc., built for 4 h.p.; £12.—185, Albert Rd., Handsworth, Birmingham. [X3348]

300 Assorted Fine Thread Nuts, bolts, washers, split pins, for 4/9, postage free; cash with order.—Hobbs Bros. and Horrell, West Heath, Northfield, Birmingham. [X3340]

P. and M. Compression Taps, 2/- each; aluminium chain cases, 30/- set; magneto cases, 5/6; tank needles, 2/- each.—P. and M. Specialist, 147, Burlington St., Liverpool. [929]

COMPLETE Sets of Gears for Bat motor cycles, 1919-20 models, delivery from stock.—The Motor Gear and Engineering Co., Ltd., High Rd., Seven Kings. Phone: Ilford 541. [8813]

SPEEDOMETERS.—Why not check m.p.g.? Saves pounds. Cowey 50/-, Watford trip £3/5, Bonniksen trip £4, Jones £2, Smith £2/5. Spares, practically every instrument stocked.—Below.

J.S. Belt Rim 45/-, J.A. 35/-, Armstrong 30/-, J.S. and J.A. axles 11/6 each (new stuff). Tremendous assortment 3-speed gears, second-hand, guaranteed perfect.—Below.

WHY Not Exchange Present Gear for one of the latest kick-starter models? Sturmev and Albion stocked. Let me quote exchange price.—Below.

IF You Haven't Gears at all, why not one of mine that I have taken in part exchange, all perfect. Albion plain models £4 each, Mark VI. 3-speed wheels £7, Roe 2-speed box £3/10; gear complete with controls.—Below.

T.D.C. 2-stroke Engine, £5/15; lightweight frame for 2-speed, £3/10, new; Saxon lightweight forks, new, £3/5; Druid lightweight, perfect, 50/-; ditto heavyweight, £3/10; special clearance line spring forks, £2/2 each.—Below.

BRAND New 60 amp. 4 volt Accumulators, 26/-; P. and H. lighting set, new, 30/-; Klaxon horn, new, 17/6; Triumph 1912 cylinder, perfect, 50/-; Triumph countershaft brake, new, £1. Stamp reply, please.—Syd. Pearson, Cate House, Cheltenham, Coventry. Tel.: 1639. [X3401]

The Future of the Lightweight.

ATENDENCY which will not have escaped the notice of observant readers, is that lightweights are gradually taking the place of heavier machines. The reason is not far to seek, and the fact that small engines have been found capable of all that is usually required in the way of speed, power, and reliability is a sign of genuine progress.

At the moment the 350 c.c. engined machine is a most popular type of solo mount, and before many years have passed it may give place to the engine of 250 c.c. or less. Already this type, which *The Motor Cycle* has done so much to encourage, is becoming increasingly popular, and its records on track and reliability trials have proved the capabilities of the miniature engine. Increased technical knowledge and improved production methods have led to the development of a lighter, handier, and more economical machine fully capable of the performance of the larger pre-war types, and there is little doubt but that the progress will continue. There are some who doubt the ability of the smaller machines to maintain their original efficiency for reasonable periods, but this largely resolves itself into a question of cooling, lubrication and valve wear. All these subjects are receiving close study by experts, and already the results obtained warrant a most optimistic outlook.

There will always be a market for the heavier machines just as there is a market for powerful cars, but with the development of the light and economical motor bicycle selling at a moderate figure we are approaching a bigger market and wider field than has yet been opened to the industry. There are many potential riders to-day who find a heavy and powerful solo mount too cumbersome to handle, and merely await the introduction of light and efficient "go-anywhere" mounts, capable of reproducing the performances of 500 c.c. machines of pre-war days.

Second-hand Bargains.

SOME remarkable bargains are available just now in the second-hand market; and it is no exaggeration to say that sixty pounds spent to-day will go further than one hundred did eighteen months ago.

However, the trouble is that people who most assuredly will buy second-hand mounts in the rush season next spring simply will not realise the wisdom of making their purchases now; when prices are lower, choice is unlimited, and, incidentally, the whole winter months are before them to make any necessary renovations.

It is a case where cause is irremediably mixed up with effect, i.e., prices are low, because people are not keen on buying; and those who realise this will benefit correspondingly.

Especially is this the case with this year's machines that are now being offered for sale. For it may be taken for granted that the man who sells a machine after only six months' use is often a faddist, who simply wishes to be in the fashion. Such a seller does not drive a hard bargain, for his chief anxiety is to get rid of his machine at a reasonable figure in order that he may be free to purchase the latest fancy.

But those who have followed the descriptions of new models in recent issues of *The Motor Cycle* will have noted that many of the leading firms are not making drastic alterations for next year. Therefore a 1921 machine at 20% to 30% off the published 1922 price is a very genuine bargain indeed. Motor cycles have now reached such a stage of perfection that minor improvements only are possible if we restrict these remarks to existing and recognised types. When an entirely new and unorthodox design is introduced, manufacturers have more scope to introduce many modifications, but unorthodox types are not snapped up readily, and often it entails many months of demonstration in leading competitions before buyers are tempted in large numbers.

Occasional Comments

BY
IXION

Toll Bridge Fees.

ONE of our readers writes imploring me to denounce toll bridges and their fees. In old days, when there was no Ministry of Transport and no central fund, somebody had to pay for new bridges, and the idea that all users should contribute was by no means illogical, though some of the old tolls were doubtless continued long after the capital outlay had been repaid. Our forefathers suffered much more than we do from these tolls, as any motor cyclist with eyes must have noticed from the still recognisable relics of old toll-houses. Nowadays, one has to think to recall the whereabouts of the few survivors. I recall one in the Somerset marshes near Athelney, and another at Eynsham near Oxford. The C.T.C. did yeoman work in abolishing a number. However, my correspondent's ire centres round Shoreham Bridge, where motor cyclists are compelled to purchase return tickets available for the day of issue only. He is in the habit of week-ending on the further side of this bridge, and gets mulcted in two return tickets weekly. This certainly seems extortionate.

Wanted, a Chain-catcher.

DEAR me. I had nearly fallen into the nasty habit which a far more famous publicist than myself possesses of gassing about "my powerful pen." At any rate, bloodstains at the bottom of the office steps mark the *finis* of the latest appeal for a free advertisement in this column. The tame inventor in question had evolved a powerful electro-magnet for fixing to the chain stays of machines which employ a separate chain on one or more gears. But the tale he told to justify the invention of a catcher for broken chains was so pathetic that perhaps I ought to have expelled him from my sanctum more gently. He had seven children too, poor fellow. Anyhow, it was thuswise. He was ascending Hindhead on the low

gear of his cycle car. Arrived at the Punchbowl, he changed up. Nothing doing. Chain gone. He remembered that a motor 'bus, proceeding downwards, had passed him just after he changed down. He knew where that 'bus garaged. He hied him thither. The 'bus driver set about him with a Ewart tyre lever. Why? Yes, the 'bus driver had picked up the broken chain all right. He had run over it with one of his new giant pneumatics, which had incontinently burst. Hence the patent electro-magnet. Perhaps I ought to have led the poor chap down those stairs.

It Started Too Easily.

POOR Smithers. His last 'bus had been stolen from outside his place of business, so he decided to protect the new stinkwheel twice over. *Imprimis*, he insured it for every penny it was worth, as all good motor cyclists do in these days of light-fingered gentry and novices awheel. In the second place, he fitted a very patent anti-thief lock to the steering head, which prevented the front wheel from being turned to the right hand or to the left. It fell on a day that Smithers came out of his office rather late and in a big hurry. He tickled the float; dug heavily on the kick-starter, sat down, opened his throttle several inches, and let in his clutch. Alas! The steering head was well and truly locked. Smithers is now trying to persuade the insurance people that the resulting smash was a pukka accident according to the terms of the policy. The latest bulletin is to the effect that they are not specially sympathetic.

Turps for Tight Nuts.

HERE is a small tip for the amateur overhauler. The last year or two has evolved quite a lot of engines with overhead valves, some of which have detachable heads, whilst one or two have stud fixings for the inlet and exhaust pipe joints. In

Occasional Comments.—

these constructions, a multitude of rather small nuts are involved, and they often screw on to very light studs, not too sturdily embedded in fairly fragile bases. As these fixings are commonly exposed to extreme heat and eke to whatever rain may fall, overhauling day often finds them either rusted or welded home to such an extent that dismantling becomes a perilous business. To apply a big spanner in such circumstances is asking for trouble. The stud will either come away from the casting, or shear in half. My own method consists of graphiting the threads when I assemble the parts, and doping them with turps before I try to get the nut loose. Even then, I have occasionally found it necessary to heat the nut before it could be induced to part peaceably from the stud. I am strongly of opinion that designers must devote fresh attention to these light studs on the cylinder heads of both car and cycle engines. But newcomers to this particular type of engine may find themselves compelled to use a cold chisel and return the casting to the factory unless they heed the words of one who has suffered much. Turpentine penetrates more rapidly than paraffin, provided anything can penetrate at all. A spanner which entirely surrounds the nut should be used if the available clearances permit; for open-ended spanners of small size are very fond of gaping under such conditions. A tube spanner is better than any other variety, provided it can be applied to the nut.

A Tyre-changing Table.

ONE of the cleverest accessories in the car world is the Ewart tyre-changing table. I daresay the demonstration cover which I saw operated fitted its rim like an old glove, but I should be a proud man if I could coax a sloppy old motor cycle cover back into the rim as the operator wangled back his gigantic cover. He merely laid his wheel on a sort of afternoon tea table, seized an immense lever resembling a clothes prop, gave the cover one prod, and then lounged rapidly once round the table, and presto! the tyre was on. If I were tyre hand in a big garage, I should certainly go

on strike till my boss bought one of these gadgets, although I know that, so far as motor cycle tyres are concerned, it is a matter of pride with even a moderately skilful man that he handles them without the help of tyre levers.

Intention Indicators.

RECENT developments suggest that there may be a tiny boom in electrically-lighted indicators for affixing to the back of a car, and showing when it is about to turn or stop. I sympathise deeply with a well-known motorist who was chaffed at Olympia for carrying his head on one side like a robin; he explained that his new car had four-wheel brakes, and stopped so suddenly that he had got a stiff neck from looking over his shoulder to see if anybody was ramming his back number plate. All the same I hope that traffic indicators will either become universal or keep away altogether. We motor cyclists have quite enough to watch without scrutinising the tail of each car we overtake, to see whether it has a signalling device or not, and if so, what the signal is doing.

Three Little-known Details.

I HAVE been experimenting with various patterns of electric lighting on a fast roadster. In the course of these experiments I have been reminded of several small points which may interest those to whom they are not chestnuts. First and foremost, dry battery

sets are *not* powerful enough for sports machines. Secondly, any accumulator set gives plenty of light, but it does not seem to be the easiest thing in the world to steer at 60 m.p.h. with a heavy big-capacity accumulator on the back of your handlebar. Thirdly, most dynamo outfits absorb a little horse-power. It is not much—probably ranging from .05 to .1 h.p.—but it is enough to ensure your defeat by a sister machine sans dynamo in such a really earnest scrap as Bycoklands or a good club hill-climb may present. So the speed model, which occasionally goes bang out in a scrap, demands a lighting set which can be rapidly jettisoned in case of need; that is one of the advantages of spring bell drives for dynamos.

One has not to go far from one's own locality to find new interests little dreamed of until they are examined. Here is a handsome lych-gate which a Sunbeam owner has discovered just off the beaten track.

MOTOR CYCLES FOR THE POOR IN HEALTH

Advice for Those who Doubt their Physical Ability to become Successful Motor Cyclists.

By JAMES F. BLACKETT, M.D. (Lond.)

THERE is no doubt that quite a large number of people take a keen interest in motor cycles, who yet possess no machine of their own. They feel drawn towards the sport, and yet do not indulge in it. What are their reasons?

Generally, it is a question of finance. A motor cycle cannot be bought without some spare capital, nor can it be kept running without spare income, and many simply cannot afford these expenses, modest though they be in relation to the enjoyment obtained.

There are also many whose health has been in some way impaired, who hesitate on that ground alone; they fear that the physical strength required is too great, or that the mental strain too continuous for them to undertake without their suffering in some way as a result. As a medical man with a good deal of motor cycle experience, I should like to lay down a few principles to guide such people, because in most cases, if suitable and reasonable precautions are taken, their fears are groundless.

Physical Demands of Driving.

One cannot, of course, get away from the fact that driving a motor cycle implies physical exertion. But the amount varies within wide limits. You may be in a hilly district with an old, fixed, single-speed, which fails at frequent intervals; or you may have a new kick or handle-starting big twin. There is all the difference in the world between what you *may* do with the former, and the least you *need* do with the latter. If you are not *fit* in health, never do more than is really necessary, unless you can do it without physical discomfort. What you cannot do comfortably you cannot do safely is a golden rule which will seldom lead you far astray. Fortunately, the converse is nearly always true also. What you can do in comfort you may do in safety.

There are certain types of disability which should absolutely debar those who suffer from them from riding. Active heart disease is one. Now, I mention this on purpose to add that this does not by any means necessarily include what is often vaguely called a "weak heart," nor even chronic valvular trouble of which the patient knows nothing beyond what the doctor tells him. If there is any doubt, it is naturally wise to get medical advice, but, generally speaking,

there need be none if the moderate exertions of ordinary life do not cause an undue amount of breathlessness or palpitation. As a matter of fact, many a person whose heart is not quite normal might very well get much more physical enjoyment out of life than he now thinks possible.

Another difficult problem is the consumptive. Here one is more inclined to say "Hold back," than to give any encouragement. Many consumptives undoubtedly do use a motor cycle, and often get much enjoyment from it—but none can do so without a certain amount of risk. There is always the possibility of some sudden and severe physical exertion being required in an emergency—and that way lies a hemorrhage. A consumptive should invariably get medical advice before undertaking the form of sport we are discussing.

Defective Sight and Hearing.

Defects of sight and hearing require careful consideration. Let us take sight first. If a person is blind he obviously cannot be trusted to drive any vehicle. The difficulty arises when one tries to draw a line between the two extremes of perfect vision and no vision at all; and there are, of course, two points of view, that of the would-be-driver, and that of the might-be-driven-into. Generally speaking, however, the ocular trouble is easily rectified by spectacles of not too high a power. A short-sighted person is almost bound to wear glasses, while the long-sighted or astigmatic is likely to find it very tiring without. It is extremely unwise to continue to drive if it is constantly associated with severe eye strain.

As regards safety from accidents due to collisions, and so forth, it is difficult to lay down hard and fast rules. Perhaps one might suggest that no one should drive unless or until he can see well enough to tell the time by a neighbouring church clock, or to recognise a friend on the other side of the street.

It is a little different when we come to consider defects of hearing. The question then is rather one of avoiding accidents with the machine than of risking damage to the ear. Only exceptionally does the latter point arise. There may, of course, be a very real danger in the former, but whether there is or not in any particular case must be decided on general rather than on medical grounds. I need, therefore, say no

Motor Cycles for the Poor in Health.—

more about it here. For the same reason I do not touch on cases where there is loss of limb, stiff joints, and so forth, although the correspondence columns of *The Motor Cycle* frequently testify that many disabled riders enjoy the pastime with comfort.

The Neurotic Temperament.

There is, however, one other large group I want to talk about. How often one hears highly strung excitable individuals, who have no definite physical disability, exclaim, "Oh, I am sure I should never be able to drive a motor cycle, I should be much too nervous." Sometimes, of course, they are right, but I should like to say, and to emphasise the statement, that in most cases their fears are without foundation. What such people suffer from is lack of self-control. Now driving demands a certain concentration of purpose and control of the will—the exercise, in fact, of those qualities which in neurotic temperaments are imperfectly developed. But within proper limits exercise leads to growth. If a man has to *force* himself to do certain things he is likely to neglect them. If, however, he is led on, or constrained to do them because they are associated with other pleasant or

interesting acts, this neglect will not occur. Driving constrains a person suffering from "nerves" to use that moderate amount of self-control and concentration of thought which he will find of the utmost value in ridding himself of his disability. In addition, it gets him out into the country and provides him with a new and absorbing interest. The whole question might well be considered from such points of view by those concerned. Of course, excessively long journeys, especially at night, should not be undertaken by those with a debilitated nervous system.

Reassurance.

In conclusion, one may say that nearly always when a man hesitates to get a motor cycle simply from fears as to health and comfort, he may be reassured. Those with serious disease do not often raise the question at all—they know quite well that to do so would be foolish. There are, of course, exceptions. Some people really are on the brink of a precipice of which they are only dimly aware, but, after all, one must take some risks in life. If one uses a little common-sense, and bears in mind that the limits of comfort seldom exceed those of safety, one has a guiding rule which will hardly ever lead one wrong.

TRINAFOR HILL, PERTHSHIRE.

The motor cycle places those who are poor in health on an equality with their stronger brothers, so far as the exploration of remote districts is concerned. Without a motor cycle only the most hardened cyclists or pedestrians can hope to visit such places as depicted above.

Since the last list of Records was published in "The Motor Cycle" of January 1st, the majority of figures have been changed.

CLASS C.—For motor bicycles of which the cylinder capacity does not exceed 500 c.c.

WILD LIFE ON THE ROAD.

Notes from the Country Diary of a Motor Cyclist.

IT is not infrequently laid to the charge of the motor cyclist that he loses all the joy and beauty of rural England; that he has no soul above pace, and that he tears along highway and by-way without any eye or appreciation for the scenes and sounds, the poetry and picturesqueness, of the things around him. That this is an ill-informed libel most of us know. We also know that it is the very heart of the country, the love of the beautiful, the appeal of the poetry of rural England, and the love of Nature generally which has converted more than fifty per cent. of us to motor cyclists, and which draws us out from the smoke and din of the town into peaceful pastoral districts where, both when travelling and when halted at some woodside or other place which has commanded us to stay awhile, we are sympathetic students of the wonders around us.

Naturalists Perforce.

As a matter of fact the study of Nature is forced upon the motor cyclist, and one constantly hears men, who would be the last to claim intimate acquaintance with the drama, pathos, humour, and excitement of the wild life of the field and hedgerow, describing most interestingly, experiences they have had which many an avowed Naturalist has courted and waited for all his life. The fact of the matter is that the motor cyclist is brought face to face with Nature in all her moods and vagaries. The power of observation being essentially quickened in him, he gradually finds himself watching and expectant for those sudden appearances and incidents which add to the interest of a country ride. Listen to a party of motor cyclists discussing their recent journeys. True, they will discuss the state of roads, how their machines climbed certain well-known hills, and so on, but they will also narrate how a stoat crossed in front of them in hot pursuit of a rabbit on a certain road, and how they pulled up to try and see the end of the tragedy, and, if possible, to save the terrified victim, whose bulging eyes had, as it were, appealed for help from the cruel blood-sucker which

was relentlessly following. Or, they will tell you how, when they were coming back in the moonlight from a run, the light from their lamps showed up a fox which had been crossing from one hedgerow to the other, and had been fascinated by the glare. Poor

"The hare simply runs straight ahead."

Keynard, with all his quickness of thought and action, with all his cunning and powers of extricating himself from difficult positions, found himself bewildered and faced with a new problem, which for the moment mystified him. This brilliant light was not the moon gone mad! No, there was the cold, steely moon above, quite normal, and casting its deep protecting shadows over the highway at the very point of it he had chosen to cross near the big old elm tree. This light was more powerful than the moon; it was

some marvellous caprice of the sun perhaps which had not aforetime come within his reckoning. It blinded him, it petrified him, and, oh horrors! it was assuredly coming nearer and nearer, and bringing with it a noise which he had often heard before, and which no longer had terrors for him. But that light—it was mesmeric. He pricked his ears, he lifted up a pad in readiness for action, his body quickened, but his eyes moved not . . . and the light came nearer and nearer, so that he, who prided himself on keeping in the shadows, on running along dark hedgerows so that he could not be seen, or along the furrows in ploughed fields so that his own colour blended with the upturned soil, was now in full view. Yes! there was the white tag on his brush and the sheen on his glossy, russet coat; there were those

wonderful white teeth showing as he turned up his lip in nervous anger. But he did not really mean to show fight. That glare was some unnatural enemy he dared not face, for behind it was a huge monster—at least, huge to him—which throbbed and smelt. He must trust to his legs. So, when the motor cyclist was within a stone's throw of him, he wheeled round and bounded through the opening near the old tree, and was lost in the deep shadows, suffering, no doubt, from a bad attack of palpitation of the heart.

"Or how the light of their lamps showed up a fox."

Wild Life on the Road.—

Another will tell you how from each side of the road the little pale and yellow moths flew towards his lamp, and, without ever seeming to be in a hurry, yet appeared able to keep pace with the machine for quite a distance till a sudden gust-of wind took charge of them and either brushed them aside, or sent them full in the face of the man in the saddle. The moths do not sting a bit, but we all know how those hard, busy, buzzing, black beetles *do* give us a momentary pin prick when they meet us full in the cheek. The collision is probably a much nastier jar to them and sends them quite silly for the remainder of the evening. Sometimes I think that the moths just mentioned come and go quicker than we imagine. That it is not the same pale-winged moon-flitter which accompanies us along a stretch of road, but that fresh moths are drawn by our light from the vegetation of the hedgerows and continually take the place of those which cannot "go the pace."

The Hare and its Ways.

I cannot quite decide whether the hare is more foolish than the fox, or whether he is really quicker witted. All naturalists speak of the hare as being rather a "fool animal," whilst "the timid hare" has come to be quite a recognised term. Most of us have had much more experience with hares or rabbits than foxes or stoats, whilst very, very few of us have badger tales to tell. When a hare lops out of the hedgerow, having just left its form in a tussack of rough grass, and, with the intention of making a meal in a turnip field on the other side of the highway, and discovers itself at that psychological moment in the limelight, so to speak, it at once takes stage fright. But, unlike the fox, it does not tarry for a single second to face the audience, or the limelight, or the

music, or whatever you may be pleased to call it. It simply turns away from advertisement and runs straight ahead within the compass of the lamp stream. Increase your speed and puss increases hers. Then is it you begin to have an added respect for the greyhound and to recognise what wonderful speeds these animals must have. The coursed hare does not run straight for the greyhound either, as it is running now; it twists and doubles, and pops through hedges—or leaps them. But now it seems as though it cannot free itself from the light which binds it to the centre of the road. On it speeds, and the motor cyclist finds raised within him something more than the interest of the naturalist. Inherent within the breast of every man is the instinct to hunt, and the motor cyclist finds that instinct quickened. Faster he goes, full of excitement, thoroughly enjoying the fun till at last the hare finds that she is tiring and that this chase cannot last—or at any rate *she* cannot—so she absolutely flings herself in the air to right or left, and, did the cyclist stop and search the hedgerow, or the field beyond, he would no doubt discover her laid panting and her heart beating as only the heart of a hare can beat.

At Close Quarters.

A few of us have heard hares scream as we have come to close quarters with them—and the sound is thrillingly uncanny when one is alone in the quiet of the night and not expecting that almost human yell which a terrified hare can give. Some of us, it may be, have kept a hare in front of us for so long that at last she gave up what she considered a hopeless contest and allowed us to pick her up. Game on the highway belongs to no man—or any man—and we all know motor cyclists who have more than once had jugged hare or rabbit pie: yes, and even roast pheasant as a result of a ride in the dusk!

J.F.-B.

HAVE YOU MET THEM?

Types of Motor Cyclists One Meets in a Day's Jaunt.

ALTHOUGH motor cyclists as a body appear to be much the same to the casual observer, it is, nevertheless, possible to divide them into about a dozen distinct classes, and even as in the old days the animals in the Ark were classified—the most notable being the bears, the bugs, and the bumble bees—so it is with the brotherhood of the road.

The "bear" is often met with, and easily distinguished. He is the fellow who rides a Harley or an 8 h.p. New Imperial solo, and flashes through small towns and villages like a super-lubricated streak of lightning, leaving a trail of dust and flying chickens as far as the eye can see. But, if you are lucky, you may find him balked at a level crossing, and, after the dust has settled, perhaps you may have time to examine him at close quarters. Then you will see that he looks more like a bear than ever. After about a minute of stolid silence, except for the ponderous "plug-plug" from his highly-polished copper exhaust pipe, up will go his goggles, and from the depths of his cavernous helmet will issue a bear-like growl, chiefly concerning the blankety railways and their something-or-other arrangements. Then, the barrier removed, he's off again, and the dust settles

once more. But he's a friendly bear, this fellow: he will always extend the glad hand if you "strike a bad patch."

Now the "bug" is a different fellow altogether—he's to be found everywhere, but you never know when you've got him. He nips about on a baby two-stroke, and, in spite of the noise of big singles and 8 h.p. twins, you can always pick out the impertinent crackle of his little power unit. But he "gets there" every time, and the way he dodges in and out, between trams and carts and under horses' heads, makes one wonder how many years he devoted to trick cycling before taking up our "great game."

Then the "bumble-bee" is, of course, the fellow who careers around at a terrific bat on a brand new Scott, paying frequent visits to the various "flowers"—the "Three Daisies" or the "Rose and Thorn," for instance. Then he's off again, after the admiring onlookers have had time to examine his 'bus. . . . And so it goes on, there being many other types, equally distinctive and equally interesting. But, be they bears, bugs, bumble-bees, or any other type, they are good fellows all, and the more one mixes with them, the more is one tempted to say, "Who would not be a motor cyclist?"

J.A.

FROM THE MIDLANDS TO THE LIZARD.

A Tour from the Centre to the South-west Corner of England on an A.B.C.

MOTOR cyclists, who have never visited Cornwall or Devon, should consider the claims of the South-west as a touring ground. Rumours of the Dartmoor roads crowded and ruined, so far as their surface was concerned, by charrs-à-bancs have been prevalent this year; but during a recent journey in those quarters, I could count all the motor coaches I met on the fingers of one hand and even then not use them all.

Further, it has been reported that the roads in Cornwall were "generally bad"; upon the whole I found the Cornish roads in very decent condition.

Roads into Cornwall.

There are, of course, many ways of reaching Cornwall from the Midlands, the main road being through Gloucester, Bristol, Bridgwater, Taunton, Cullompton, Exeter, Okehampton to Launceston, once the capital of Cornwall, and still well-known for its gateway and beautifully situated castle. Another way is to keep nearer the south coast after leaving Exeter and, making one's way to Plymouth (via Haldon Hills, Ashburton, and Ivybridge or Starcross, Dawlish, Teignmouth, Newton Abbot, and Totnes), crossing the Tamar to Torpoint by ferry.

If one wishes to "cross the Tamar hand-in-hand," this is the best and safest way to do it, which reminds me of the fact that the northern entrance to the delectable duchy near Morwenstow is not much used, except by those who wish to try their luck or show their prowess on the Somerset and North Devon terrors—Porlock and Lynton hills.

By none of these roads, however, did I take my way, partly because a friend told me that the main road to Exeter was bad (I have since been told that it is like a billiard table), and partly because I love to cross Dartmoor when I get a chance. The fine open spaces and glorious views appeal to me greatly, so also does the nature of the roads, which in two places (one about a mile before reaching Warren House Inn and the other between Two Bridges and Tavistock) rise to a height of about 1,500ft. above sea level. There are steep hills and many turns, but there are also fine straight stretches of open road

where any speed of which the machine and its rider are capable may be attained without danger to life and limb.

The Selected Route.

Taking one consideration with another, therefore, I set out one evening about tea time, and, passing through Kenilworth, Warwick (where I met with about the worst roads on the trip), Wellesbourne Hastings, and Ettington, struck the Fosse Way near Halford Bridge. I followed this old highway to a point beyond Cirencester, where the road forks, right for Tetbury, left for Chippenham, with the Fosse Way continuing straight on between the two.

This road was good as far as Moreton-in-the-Marsh,

where a very graceful war memorial has been erected, but on both sides of Stow-on-the-Wold it was grooved by irregular longitudinal gulleys, sometimes two or three abreast, which meandered along the road in a winding course. They were probably caused by rivulets in wet weather, but when I encountered them they were dry and loose. It was impossible to avoid them altogether, and at times they caused very unpleasant wobbles.

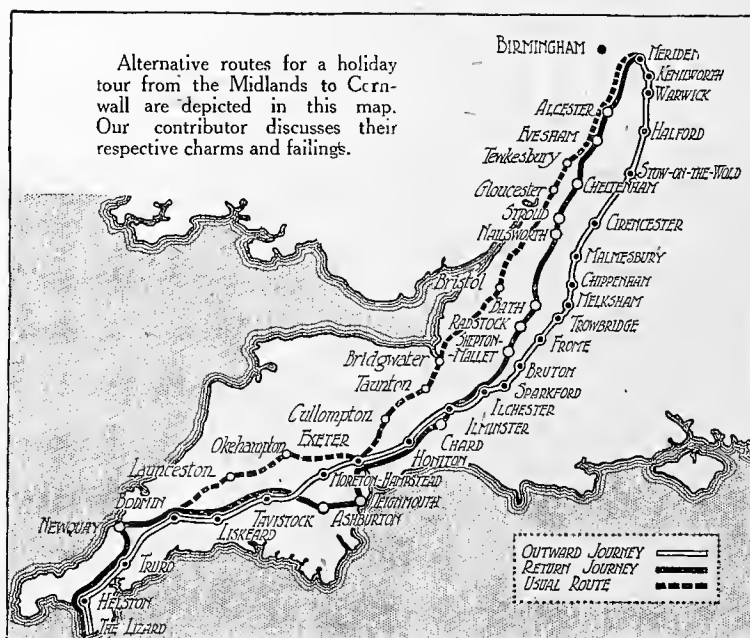

After leaving the Fosse Way as

already mentioned, I passed quickly through Malmesbury, Chippenham, Melksham, Trowbridge, Beckington, Frome, which has quite a steep main street, Bruton, and Sparkford to Ilchester, where I spent the night.

Over Dartmoor.

Next morning I found the roads good enough to Exeter, though a bit rough in places. I took the direct road from Ilminster to Honiton, and had no reason to repent of my choice.

At Moretonhampstead the character of the road changes as one approaches the open moors. Instead of twisty lanes, fine open stretches are the rule, where in places almost any speed is practicable, and, with one or two reservations, safe. The roads do not always run up and down the hills at right angles to the streams, while the bridges do cross at right angles, hence there is a double turn at the bottom of a long steep slope, and this naturally requires care.

(Top) The war memorial at Longdown, between Exeter and Moreton-hampstead.

(Centre) A graceful memorial erected in the wide road which traverses Moreton-in-the-Marsh.

(Bottom) On the borders of Dartmoor, near Bel Tor. An ancient cross can be seen on the wall.

Further, the hill which leads down to Merrivale Bridge has, in addition, a right-angled corner on a steep gradient a short distance before the bridge is reached.

Another place where care is required is on the short descent to Two Bridges, while Moorshop Hill, beyond Merrivale, cannot be ridden very fast, because of the many twists and turns combined with high banks.

The Cornish Roads.

A block of traffic caused me to stop on the long hill through Gunnislake, just after crossing the Tamar into Cornwall, but I restarted without difficulty and ascended the greater part of this hill at about 25 m.p.h. on second speed. There are one or two steep hills between Callington and Liskeard, but mere trifles compared with the Dartmoor hills, both in length and gradient.

The road down the Glynn Valley (between Liskeard and Bodmin) is excellent, and the scenery delightful. In this valley, road, railway, and river run more or less side by side for about five and a half miles. The road then rises over undulating ground to Bodmin and Goss Moor, where there is a

straight, fast stretch for three miles on a slightly falling gradient to St. Dennis. Here the surface seemed rather rough at a fast pace, but there was little to complain of. Thence the road through Ladoek and Tresilian to Truro, generally the best, or at least one of the best, roads in Cornwall, was not so good as it looked, though quite up to the general average, and the same can be said for the final stretch to Helston and The Lizard.

The scenery near Penryn, which was left about a mile on the left, is very pretty. It then becomes rather bleak, improving again near The Lizard. The town of Helston can be avoided by turning sharp to the left near the station and going through Clodgy Lane.

Helston is noted for a quaint old custom called the "Floral Dance." On Flora Day, May 8th, people dance in couples through the streets and in and out of the houses, finally finishing up at the Angel Hotel. Charles Kingsley was once a pupil at the Grammar School of this town, and Sir Henry Irving was born here.

The first permanent wireless station, that at Poldhu (or Poljew) is a landmark hereabouts. The Lizard district abounds in pretty and interesting places, viz., Gunwalloe, with its little church almost on the beach and separate belfry embedded in the rock, Kynance Cove, Gue Graze, Cadgwith and the Frying Pan, Mullion, St. Anthony, the Helford River, and Treloar Warren Woods. The cliff scenery between Mullion and

From the Midlands to the Lizard.

Kynance is wonderfully fine, and the Lizard lighthouse is worth a visit, as well as the Serpentine Works at Poltesco.

The Return Journey.

On the way home I varied the journey in several ways. In the first place, I turned aside to Newquay, where I spent a few days, and incidentally saw more motor coaches than on all the rest of the trip.

At Two Bridges I again changed my route, and, instead of going *via* Postbridge and Moretonhampstead, took the road to Dartmeet and Ashburton. On the former road there are certainly hills, but they are nothing to those on the latter. As I approached Dartmeet I saw a notice advising all motorists to engage their lowest gears to assist their brakes. This is good advice, and I was glad that I followed it, for the hill is very steep, especially near the bridge, where it winds down past the inn. The climb on the other side is about as steep and longer, but not so twisty, and I went up quickly and comfortably on second speed.

Dartmeet is a delightful spot, and one in which many days might be spent with the greatest satisfaction. From the top of Bel Tor to Newbridge the road drops about 850 feet in two miles. This includes over half a mile of easy gradient near Poundsgate, so the rest must be pretty steep, as indeed it is. Again the desirability of engaging the lowest gear is impressed on motorists, and again the advice is good.

I was now in the Holne Chase neighbourhood, and very charming it is. Near Holne Bridge there used to be a very famous hairpin turn, but the latest road avoids this, and the present hill is not to be compared with those I had lately negotiated.

From Ashburton I followed the Exeter road for a time, then turning off through Newton Abbot to Teignmouth. Leaving next morning soon after ten o'clock, I climbed the Haldon Hills *en route* for Exeter. The view from the top of these hills must be seen to be properly realised. The downs and woodlands are varied by glimpses of the estuaries of the Exe and Teign, and backed by the sparkling sea of the channel beyond the red sandstone cliffs of Dawlish.

At Exeter I joined my outward route and followed this as far as Ilchester, with the exception that I took the road through Yarcombe and Chard between Honiton and Ilminster, but the direct road is to be recommended, running straight through Ilchester and along the Fosse Way, missing Shepton Mallet, to Radstock and Bath.

I was soon out of Bath and climbing the hill on to the Cotswolds, where there is a fine open road over the hills, till it drops at Nailsworth, and running through Stroud leads to Cheltenham. Thence I rode through Evesham, Alcester, Henley-in-Arden, and so home again. The return route from Ilchester was, on the whole, preferable to the road I traversed on the outward journey.

My Mount.

Up to the present I have said but little about the machine I rode—a 3 h.p. A.B.C.—but I think that a few words are its due. On a trip approaching 600 miles I averaged somewhere about 95 m.p.g. of petrol, and did not once have to replenish my oil tank. Only once was it necessary to touch the engine, and that was to clean a plug near Teignmouth after somewhat liberal oiling for the run across Dartmoor. The transmission (bevel and Renold chain) and tyres (Palmer cord) gave no trouble at all.

AURIGA.

A typical stretch of Dartmoor country. Although not an ideal speedway, the exhilaration of riding across this wild open country on a fine day has to be experienced to be fully appreciated.

RENEWAL OF MOTOR LICENCES.

MOTOR cyclists are reminded by the Ministry of Transport that they must produce their registration books when application is made for a renewal of licences for the year 1922. In the event of the licence book having been lost, the matter should be immediately taken up with the appropriate

licensing authority, so that delivery of a duplicate may be expedited. It would be well, therefore, if all motor cycle owners made sure at once that they are in a position to comply with the Ministry's requirement in this respect; for the taxation offices are likely to be very busy in a week or two.

MISLEADING HORSE-POWER RATINGS.

A Plea for Closer Relationship between Cylinder Capacity and Makers' Statements of Nominal Horse-power.

TO the initiated the yearly increase in anomalies of makers' horse-power ratings is merely silly; to the novice it is most confusing.

In most cases nowadays the buyer has ceased to consider the "horse-power" of a possible purchase at all; he wisely delves into the question of cubic capacity as the basis of further comparisons of value. It would seem opportune, therefore, that a revision of the whole matter be made forthwith, especially emphasising the fact that makers' horse-power ratings are purely intended to be nominal indications of what the various sizes of engines *should* develop, and that they are not intended to illustrate what each particular engine *does* develop—on brake test or otherwise.

Looking Back.

For many years it was the pleasing custom of manufacturers to preserve some sort of modest uniformity, and for the benefit of newcomers to the pastime we may recapitulate the recognised scale. A 250 c.c. engine was $2\frac{1}{2}$ h.p., a 350 c.c. was $2\frac{3}{4}$ h.p., a 500 c.c. was $3\frac{1}{2}$ h.p., a 750 c.c. was 5-6 h.p., and a 1,000 c.c. was 8 h.p. So long as the majority of machines came very close up to one or other of these arbitrary limits—and, before the war, they did—all was well, and there was little or no confusion. Then bigger singles of 500-650 c.c. began to gain popularity under the titles of "fours," "four-and-a-quarters," and "four-and-a-halves," but bearing no relations to their comparative capacities. A little later somebody realised that 499 c.c. engines develop more than $3\frac{1}{2}$ h.p., and emphasised the point by calling his product a "four." The fat was properly in the fire now, and it was not long before a 350 c.c. two-stroke became a " $3\frac{1}{2}$ h.p." And since then things have gradually been getting more involved.

At 2½ h.p.!

For example, several firms now list models fitted respectively with the 293 c.c. and the 350 c.c. J.A.P. engine—the latter a comparatively new product. Both are rated at $2\frac{3}{4}$ h.p.—which is absurd. Even worse is the case of the concerns also marketing a 269 c.c. Villiers model, to which is given the common estimate of "two-and-threequarters." Then the 350 c.c. Beardmore-Precision has been $3\frac{1}{2}$ h.p. for some time now, which brings about an awkward *contretemps* when a 350 c.c. Barr and Stroud engine (3 h.p. according to its manufacturers) is fitted to an additional model. Thus two 350 c.c. machines produced by the same firm are rated as 3 h.p. and $3\frac{1}{2}$ h.p. respectively.

Among the 1922 sidocar machines, we find such glaring inconsistencies as a 370 c.c. Connaught (" $3\frac{1}{2}$ h.p.") and a 633 c.c. Norton ("4 h.p."), with only the $\frac{1}{2}$ h.p. variation in nominal rating which separates the 499 c.c. Rover ("4 h.p.") and the o.h.v. 499 c.c. Triumph (" $3\frac{1}{2}$ h.p."). As a correspondent points out, insurance policies are rated on these figures! Again the 4 h.p. Norton is nearly 100 c.c. larger than the 5 h.p. Stanger, and, if the 500 c.c. Dunelt had not reverted from 5 h.p. to 4 h.p. for next year, there would have been an even more

striking example of the futility of the whole business. As already indicated, ratings of "4," " $4\frac{1}{4}$," and " $4\frac{1}{2}$," are bestowed with a most amazing lack of discretion.

Mysterious Gain of 3 h.p.

One example of discrepancies in the big twin class will suffice to clinch the argument—if that is at all necessary. The 996 c.c. M.A.G. engine (air-cooled) is fitted to the 7 h.p. Matchless; the 996 c.c. M.A.G. engine (water-cooled) is fitted to 10 h.p. cycle cars.

Owners of 1921 machines also are very puzzled when the 1922 models of their mounts gain $\frac{1}{2}$ to 1 h.p. by improvements to brakework or gear control, when so far as they can see the engine has been unaltered. They wonder if they are justified in increasing the ratings of their own possessions when disposal time comes.

Several solutions have been suggested; in fact, that is probably why there has been no successful attempt to amend things sooner—there are so many ways of doing it.

Go back to the good old-fashioned scale, says one group. In that case, the standard classification would be tabulated as follows:

Not exceeding	250 c.c.	...	=	$2\frac{1}{2}$ h.p.
From	250 c.c.	to	300 c.c.	= $2\frac{1}{2}$ h.p.
"	300 c.c.	"	350 c.c.	= $2\frac{3}{4}$ h.p.
"	350 c.c.	"	400 c.c.	= 3 h.p.
"	400 c.c.	"	500 c.c.	= $3\frac{1}{2}$ h.p.
"	500 c.c.	"	560 c.c.	= 4 h.p.
"	560 c.c.	"	600 c.c.	= $4\frac{1}{2}$ h.p.
"	600 c.c.	"	700 c.c.	= 5-6 h.p.
"	700 c.c.	"	800 c.c.	= 6-7 h.p.
"	800 c.c.	"	1,000 c.c.	= 8 h.p.

This would mean a considerable drop in nominal horse-power for several machines, but, apart from the fact that it is not very fairly graduated, it has much to commend it. It would probably mean a lesser number of catalogue alterations and reprints than any other scheme.

More revolutionary, but more nearly approaching the truth, is the suggestion—which has been ventilated many times in the past in the pages of *The Motor Cycle*—to allow 100 c.c. to represent one horse-power. Thus:

250 c.c.	= $2\frac{1}{2}$ h.p.	400 c.c.	= 4 h.p.
300 c.c.	= 3 h.p.	500 c.c.	= 5 h.p.
350 c.c.	= $3\frac{1}{2}$ h.p.	550 c.c.	= $5\frac{1}{2}$ h.p.

and so on.

An Attractive Plan.

Two alternatives present themselves here. Each machine might be rated to the nearest quarter horse-power (a 269 c.c. Villiers engine would be $2\frac{3}{4}$ h.p., a 293 c.c. J.A.P. 3 h.p.), or it might be taken decimally to one or two figures (269 c.c. = 2.7 h.p. or 2.69 h.p., and 293 c.c. = 2.9 h.p. or 2.93 h.p.). The latter method appears most attractive on paper, for the cubic capacity of an engine would immediately be apparent from its nominal h.p. rating.

Which suggests yet one more way out of the muddle. Why not banish horse-power altogether and classify a machine by its capacity only? Several writers have been driven to this already.

A Successful Season's Running of a Public Conveyance at a Seaside Resort.

WHEN the first taxicab appeared with a motor cycle as its means of propulsion, it was ridiculed but much photographed; it drew crowds at Olympia, and it set many wondering as to whether good business might be done with this type of vehicle.

Nottingham was the first city to license sidecars, and others have followed, notably several seaside resorts, including Southsea, Torquay, and Southampton. Many other local authorities have refused licences, but it can only be a question of time before their prejudices vanish.

In June last, two B.S.A. sidecar taxicabs were licensed at Clevedon, the quiet little town on the Bristol Channel. So far they are the only two in Somerset. The owner-drivers, W. Wood and B. Ackrill, have had a very busy season, in spite of considerable taxicab and motor bus opposition.

No Mechanical Trouble.

Technically, the owners have nothing but praise for the 6-7 h.p. B.S.A. machines. Referring to the outfit with the largest mileage, it has covered 4,063 miles since early July, and has been decarbonised only once. No mechanical trouble of any sort has been experienced; it continues to start with remarkable ease, maintaining its power and efficiency excellently. Petrol consumption on short runs is 38 m.p.g. and on long runs up to 45 m.p.g., this using a 31 jet.

In appearance, which goes for much on the rank, it wears very well, still retaining much of its original smartness. This applies also to the sidecar, though the upholstery of one has worn quicker than that of the other cab. A very good point is the ease with which

the back wheel may be changed, thus making the loss of time through punctures negligible.

There are certain criticisms to be made, however; the chief is the abnormal wear of back tyres. Whilst the original Palmer cords are still in fair condition on the front and side wheels (over 4,000 miles), each rear wheel has worn out several covers. Palmer, Goodrich, and Dunlop have been tried, and the best service obtained from one cover is under 1,500 miles; naturally, this forms the chief feature of the running costs.

There is urgent need for a good ratchet brake on these vehicles; the second cab is now in dock, due, indirectly, to its running away when left unattended on a slope for a moment. Had a ratchet brake been available, this could not have occurred, and an unusual expense with several weeks' loss of revenue, which still continues, would have been obviated.

The Lucas Magdyno has behaved perfectly, troubles, if any, having been trivial. A short run served to show the writer that the easy steering qualities are excellent, not the slightest pull being noticeable, in spite of the unusual width of the sidecar.

The Business Standpoint.

The fares charged are: 9d. per mile, with a reduction to 8d. on journeys over twenty miles; one hour waiting is reckoned free on such journeys and 2s. 6d. per hour after; shopping runs are charged at 3s. per hour.

Without going accurately into detailed expenditure, the total running cost per mile may be taken as between 5d. and 6½d.

Through a busy summer season each machine should average fifty to seventy-five miles per day. Obviously, this must be maintained to

The excellent luggage accommodation of the average sidecar taxi is not always realised as it stands for hire on the rank.

The Sidecar Taxi.—

allow a margin for the off season, but it should be noted that the chief item in the running cost—tyres—may be considerably reduced when the most suitable tyre has been found; at present this item accounts for approximately fifty per cent. of the cost per mile.

General maintenance is small, as the owner-drivers are expert mechanics and do all their own repairs. There are few expenses additional to that of the ordinary sidecar outfit—the hackney carriage licence, a stand licence, and garage rent.

Prospects.

Generally, from the experience of these two owners, it is assumed that, given a season of fair weather without national disturbances affecting holiday-making, a reasonable luck with tyres, skilful personal attention to maintenance, a sidecar taxi business in a small seaside resort or country town is likely to be a profitable one. In a busier centre, a manufacturing town, with extensive residential suburbs where the trade will be equal all the year round, such a business should prove quite a good thing.

WESTERNER.

VALVE GRINDING.

A Tip to save Trouble when only Hand Tools are Available.

ALL motor cyclists know to their cost that valves must be ground in at intervals if they expect their engines to continue running in a really satisfactory manner. These intervals vary very much with different machines and different individuals, for they depend largely upon the quality of the valves, especially as regards their ability to stand great heat, and quite as largely upon the way in which the machine is driven. Those who, like my friend "Ixion," drive "very blue," must expect to pay for their fun in more frequent valve grindings and more work with a screwdriver when the operation takes place. Long periods of running with an open or nearly open throttle are bound to have their effect in increasing the heat of the engine, and consequently of the valves, more particularly of the exhaust valve, and it is this heat that causes the pitting of the surface. The inlet valve, which is constantly cooled by the incoming gas, very seldom needs grinding, and when it does a very little work generally restores its original condition.

Now since it is admitted that valves must be ground at more or less frequent intervals, it may be worth while to consider briefly how this may be done

most effectively and with the least amount of trouble. There is no doubt that a lathe is ideal for the purpose, but few have access to one.

Typical inlet and exhaust valves after considerable mileage. Note how the exhaust seating (on the right) has been ground down, thus restricting the free passage of the gases

First, let me say that it is most undesirable to do all the valve grinding in the engine, for this method, although it grinds the valves well enough, also grinds away the seating which seldom needs any grinding at all, and results in time in making pockets which interfere very seriously with the ingress of the explosive mixture or the egress of the burnt gas—generally the latter, since it is the exhaust valve that gets most grinding.

Makeshift Apparatus.

There are upon the market one or two excellent valve cutters designed with a view to achieving this very object of truing up the valve without injuring the seating, but I am supposing for the moment that the motor cyclist is not possessed of any special tools of this sort, but only an ordinary workshop equipment such as is owned by many amateur mechanics and carpenters,

and that this equipment includes a hand drill having a three-jaw chuck capable of grasping the valve stem.

If the hand drill with the valve in its jaws be firmly held in a vice, it can be used somewhat in the manner of a miniature lathe. It will not be rigid enough to enable a cut to be taken with a tool, nor would it be very easy to hold the tool steady, but the worst of the pitted surface can be removed by holding a file or a carborundum stone against it, after which the valve can be finished off in the engine, and as the major part of the work has already been done this will make but little difference to the seating.

Hand Methods.

I have personally used the method above described for some years with the greatest satisfaction. Some motor cyclists file the worst of the surface off their valve faces and afterwards finish them by grinding in the usual manner, but this procedure requires more skill with the file than the average amateur mechanic possesses. Richford grinding paste, used sparingly or the finest carborundum powder, should be used for finishing the grinding; the former *may* and the latter *must* be mixed with a little oil, after which the surface may be polished with a little crocus powder and oil.

Another method of starting the work which is just as effective as holding the

valve in a drill is to take a piece of wood about as long as the valve stem, and the same width as the valve head, make a hole through it lengthwise, in which the valve stem shall be a good fit, bevel one end a little to allow room for the file, and placing it in a vice get a friend to revolve the valve with a brace while holding the file or stone against the face. Compared with the first method, this has the disadvantage of requiring two persons to carry it out, but the result should be quite as good or perhaps better, as it is easier to hold the tool firm with two hands, and moreover some sort of rest can be provided without any great difficulty, against which the tool may be steadied.

AURIGA.

A method of rough grinding with the aid of a file and a prepared block of wood. A stick wrapped with emery paper may be used in lieu of the file

Through Feminine Goggles

The Ner-a-car on the Road.

By MAB. LOCKWOOD-TATHAM.

WHEN I first saw the Ner-a-car my remark was, "What is it—a car or a motor cycle?" The frame, drive, enclosed engine—in fact, almost everything—suggest a car; yet it has handle-bars, only two wheels, and footboards. Of course, the first thing I noticed was the extraordinarily long wheelbase, and the fact that the centre of gravity was below the axles. The only detrimental point which struck me with regard to this was the very small clearance, especially in cornering or taking the machine up or down a step. Of course one does not expect to take corners at a very great speed, but if, in a moment of recklessness, much of an angle were attained, the running board might touch the ground.

The Ner-a-car has a car type chassis of pressed steel, with a special feature in the shape of a large immovable mudguard carrying two head lights—one electric, one acetylene; the latter is, of course, a "standby." The magneto supplies the current for lighting. The engine is a $2\frac{1}{2}$ h.p. two-stroke, and friction disc transmission gives five speeds.

With the exception of one foot brake and the gear lever, control is entirely from the handle-bars. The clutch is operated by a left twist grip.

Special Clothing Not Needed.

I should like to mention that when the little machine was taken over I was dressed in my usual motor cycle garb, which consists of soft leather and beaver helmet, brown suede belted coat, fawn Bedford cord riding breeches, and field boots. It was soon discovered, however, that it was quite unnecessary, so far as riding the machine was concerned. Riding would have been just as easy in skirts. Nevertheless, for a long run the costume just described has always been found to be more comfortable and very much warmer than feminine garments, which is an important point for winter riding.

I will try to describe my sensations on first mounting. I took the precaution of doing so in Hyde Park, at a spot where there was little traffic and few people except nursemaids and small boys to see me if I happened to fall off.

My engine started at the first kick, and I mounted, slowly twisted in the clutch, and wobbled away. I

soon discovered, however, that it was very nearly impossible to keep on wobbling, because the machine practically balanced itself.

It was rather a weird feeling being so far away from the front wheel, and very strange not to see the front mudguard move when turning a corner, but otherwise it soon began to feel perfectly natural.

At this point I began to feel very courageous, and decided to adventure among the traffic. So, leaving the park at Hyde Park Corner, I drove by way of Grosvenor Street and Bond Street to Conduit Street, Regent Street, and Piccadilly Circus; thence out through Buckingham Gate towards the Portsmouth Road.

In the meantime, two other Ner-a-cars and a sporting $2\frac{3}{4}$ h.p. Douglas (complete with enormous copper exhaust pipe) had joined me, and we settled down to enjoy the good roads, glorious sunshine; and general holiday feeling of Saturday afternoon.

Steering was soon discovered to be quite easy without using the hands. Direction is perfectly controlled by slightly swaying the body, and the feeling of confidence while so doing was most unusual. However, my fellow travellers quite put me in the shade on that sort of thing, and it was really amusing to see the expressions on the faces of people passing by when one of our party came along at about 25 m.p.h. standing on the engine casing with hands in pockets, or lying flat on his back on the saddle, with his feet over the handle-bars. It caused my heart to leave its usual position once or twice, particularly on tramlines. However, these things appear to be actually easier than they look, owing to the unusual design of the whole thing.

Speed on the Level.

After leaving Hammersmith and Kingston, when we were out on the country roads, there were opportunities of testing the Ner-a-car's speed capabilities. As far as I could tell without a speedometer, it

Through Feminine Goggles.—

reached a maximum of about 35 m.p.h., and there did not appear to be any undue racing of the engine at this speed, nor was there any sign of overheating.

We kept right on, doing very good time, till we arrived at the Hut at Wisley, where we stopped for tea. While it was in process I heard an amusing story of an incident which happened in the Isle of Man during T.T. race week. Two Ner-a-cars were over there at the time, and the demonstrator in charge of one of them left his mount standing outside an hotel, where the racing men are known to foregather. While he was inside a certain well-known race entrant came up and, taking the strange little machine, rode off on it. Our friend came out, found ne'er a car (!), and went off the deep end about it. Just then the star rider returned, and after listening to a storm of words said, "But you evidently don't know who I am—my name is _____". The gentleman with the Ner-a-car retorted, "I don't care if you're Lloyd George—nobody but an *expert* is going to ride this machine!"

Homeward Bound.

We had only gone a few miles on our homeward journey when the light began to fail, and I really got the sensation of driving a car when I was able to bend down and switch on electric lights. When we got into the suburbs the traffic was much thicker than on our outward journey, and I was able to judge the

capabilities of my machine under such conditions better than before.

In Traffic.

Thanks to the sliding scale of gears and throttling down capacity, it is possible to come almost to a standstill in a tight corner or at the wave of a policeman's hand.

Should it be necessary to stop entirely, a slight twist of the clutch release is all that is required, and *vice versa* to move off again. This means, of course, that one need not worry about even the worst thoroughfares.

Before reaching my destination on the home run, I was reminded, by extreme fatigue and stiffness in my left arm, that the said twist grip clutch was not entirely an unmixed blessing. I have no doubt that after continued use this would not be the case, but anyone driving the machine for the first few times would be bound to feel it. The twisting muscles of the forearm are so seldom used in the ordinary way that, particularly in traffic, where much declutching is necessary, one must feel the strain to a certain extent.

Quite a good point, as far as using the machine for shopping is concerned, is the excellent springing. I do not suggest that it would be safe to carry the eggs home on it, but certainly vibration is practically *nil*, and only very bad roads cause any discomfort.

My impression of the Ner-a-car is that it is sensible, comfortable, and adaptable. It should prove popular, particularly with ladies who do not care for motor cycling from an entirely sporting point of view. The fact that a special costume is unnecessary will appeal to many, particularly those who are past their first youth.

Nearly all the weight of the Ner-a-car being carried below the level of the hubs, there is little tendency to skid. The riding position is comfortable, and, taken all round, the machine is very controllable.

**IMPORTANT DEPARTURE BY A SCOTTISH CLUB.**

SCOTTISH motor cyclists are a small body compared with those of England, but they may fairly claim to make up in enterprise what they lack in numbers. As regards their organisation of trials, this is admitted. Now, the Western M.C.C., the principal body in the West of Scotland, has embarked upon a new venture, which will bring Glasgow on a level with Edinburgh, and put the Scottish organisations in a remarkably favourable position as compared even with the biggest clubs in England.

At a recent special general meeting of the club it was unanimously decided to proceed with the purchase of a club house at 18, Burnbank Gardens—a locality particularly suitable for motor cyclists in the West End of the city, but reasonably central for all. It was proposed to finance the purchase by issuing debentures bearing $2\frac{1}{2}\%$ interest and redeemable by ballot at convenient periods, and these have already been taken up to the amount of about £1,700 by the club members and other subscribers.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ACCIDENTALLY INTENSIFYING THE SPARK.

Sir,—The letter appearing under the above heading in your issue of December 1st from "Sparklet" is distinctly interesting as a simple means of curing a trouble to which sparking plugs are occasionally liable.

The short circuit between the sparking points is not caused by carbon, as "Sparklet" suggests, but by the actual metal of the electrodes which is carried across the gap by the spark. This action only occurs when the central electrode attains a certain temperature, and normally the cure is to fit a plug of a design in which the central electrode will keep cooler.

The fitting of an aluminium radiator under the terminal of the sparking plug would certainly have the effect of cooling the central sparking point, although it is surprising that this fitting was sufficient to cure the trouble. However, the reason why this aluminium radiator stopped the thread of metal from bridging the spark gap must have been due to its cooling effect and not to its condenser effect (as "Sparklet" suggests), because the electrical capacity of this radiator would be practically negligible.

LODGE PLUGS, LTD.

ACCESSIBILITY OF A FOUR-VALVE SINGLE.

Sir,—The four-valve Triumph is a fine example of modern engine design, but how is the sparking plug removed hurriedly, first, when the engine is cold; secondly, when hot? Erith. PRO., TRIUMPH.

MISLEADING HORSE-POWER RATINGS.

Sir,—It is commonly understood that the various present-day h.p. ratings bear no significance to the actual b.h.p. developed or to anything by means of which one engine may be compared with another. Therefore, if some formula or other could be generally adopted, the buyer of a machine could compare one engine by another. The formula $\frac{\text{cubic capacity}}{200} + 1 = \text{h.p.}$ gives correct results up to about

$3\frac{1}{2}$ h.p.; this formula is very simple, but it will be seen that using it for an engine of 1,000 c.c., the h.p. is only 6. This would no doubt upset the equilibrium of the big twin class, but would enable the h.p. rating to be standardised.

If this or any other formula is unsatisfactory, it could be extended to $\frac{\text{c.c.}}{200} + 1 + \left(\frac{\text{No. of c.c. above 550}}{225} \right) = \text{h.p.}$ Under this formula we should get:

				EXAMPLE.
200 c.c.	= 2	h.p.	...	
250 c.c.	= $2\frac{1}{4}$	h.p.	...	Diamond, etc.
300 c.c.	= $2\frac{1}{2}$	h.p.	...	
350 c.c.	= $2\frac{3}{4}$	h.p.	...	Douglas, etc.
400 c.c.	= 3	h.p.	...	A.B.C.
500 c.c.	= $3\frac{1}{2}$	h.p.	...	Norton, etc.
550 c.c.	= $3\frac{3}{4}$	h.p.	...	Scott (533 c.c.)
600 c.c.	= $4\frac{1}{4}$	h.p.	...	Sunbeam
700 c.c.	= 5	h.p.	...	
800 c.c.	= 6	h.p.	...	B.S.A. (770 c.c.)
1,000 c.c.	= 8	h.p.	...	Indian.
Nelson.				NOVICE 2.

Sir,—After reading "Speedwell's" letter in your Show Number concerning manufacturers' h.p. ratings, another aspect of the question, of more immediate interest to many motor cyclists, occurred to me. Most insurance companies

base their premium charges on "makers' h.p."; and they will no doubt take advantage of the action of the makers of the 499 c.c. single mentioned by "Speedwell" by increasing their premiums accordingly for this particular machine. Thus, the owner of a 633 c.c. Norton will be at a considerable advantage as regards actual power, while paying the same premium as the 499 c.c. owner. This is, of course, distinctly unfair to the latter.

The c.c. of an engine should be a good enough guide to its power, and would be as easily understood by the buying public as the term "horse-power" if it were as universally adopted. ARIEL (498 c.c.)

Carlisle.

[An article on this subject appears on another page of this issue.—Ed.]

TWO-STROKE FAILINGS.

Sir,—"Two-stroke" asks for the name of a machine of this type which does not burn its top piston rings. There is one—the Scott.

His trouble, however, is probably due to waiting too long between decarbonisations. On a two-stroke single last season I found that 700 miles was the limit of mileage without jamming the piston ring solid with carbon. Experience having taught this, I did several thousand miles on the same single ring fitted by these makers.

Incidentally, I fancy that this peculiarity of the two-strokes nullifies one claim that I have seen put forward for a detachable cylinder head, viz., decarbonisation without removing the cylinder. J. STUART-WHITE.

Sir,—I have a $2\frac{1}{2}$ h.p. Villiers, and have never had any trouble with burnt rings. I think that the reason for the top ring burning is because the ring is too near the top of the piston on a large number of two-strokes. It will be found that on the Villiers the ring is lower down the piston, and so is not burnt so easily by the exhaust gases, as it will be noticed that the side against the exhaust port always burns first. C.W.B.

Nottingham.

Sir,—I have a $2\frac{3}{4}$ h.p. Sun-Vitesse which has been in daily use for over two years, and have had to date one set of new rings, and then the top was no worse than the others.

Perhaps "Two-stroke," if he is a keen user of this type of machine, will try a Sun for his next mount.

I have no connection with the company.

Hants.

SATISFIED RIDER.

CONVERTED BY OUR COVER!

Sir,—I think I ought to tell you that my landlord, who hates motor cycles, was overcome by the splendid cover of your Show Report, and looked right through the journal, and decided on a Ner-a-car. I told him it was "Ixion" on the coloured cover. Am I right? [Not this time!—Ed.]

Godalming.

TRIUMPH RIDER.

HIGHEST AGRICULTURAL LAND IN GREAT BRITAIN.

Sir,—I think your correspondent, referring to some farm near Tomintoul as being "the highest agricultural land in Great Britain" must be in error. We have in Co. Durham, above the main road (itself 1,960 feet altitude) between Middleton-in-Teesdale and Cumberland, two farms on the 2,000 feet line with agricultural land. There is no agricultural land near Tomintoul above 1,300 feet. Again, the

inns at Tomintoul only stand at 1,120 feet altitude. These are surely not the highest in Great Britain! The Cat and Fiddle is 1,650. And if High Street (2,664 feet), the old Roman road (certainly paved in parts) above Haweswater, in Westmorland may count, it overlooks the Aberdeenshire road by nearly 300 feet. So that England can boast the highest road, hotel, and agricultural land in Great Britain.

(Rev.) C. D. FOTHERGILL.

IMPROVING AN A.B.C.

Sir,—One carburetter that I personally know of that will give the required tick over is the Cox Atmos. With standard timing for valves and magnetos; throttle the engine down as slow as possible, and nearly fully retard the magneto. Then adjust the pilot jet until the required speed is obtained. I am presupposing that the inlet valve guides are not badly worn, and that there are no air leaks in the induction joints. The plug points must be of the same gap each side. Personally, I also use supplementary spark gaps, which has cured the left-hand plug from oiling up.

The gudgeon pin fixings I am using are those of Capt. Maund. If within riding distance of the Len Engineering Works, Maidstone, take a trip down there; if not, then send on the connecting rods, gudgeon pins, and pistons, as the pistons have to be slightly altered for this fitting. Usual disclaimer.

I am surprised to hear that Mr. Mason found brass plates on the ends of his gudgeon pins, as the standard fixing is a steel washer.

Another tip for A.B.C. merchants. Be careful about your oil. This is a most important point.

Pinner.

A.B.C. RIDER.

[We have also received a letter from Capt. Maund on behalf of Rootes, Ltd., Len Engineering Works, Maidstone, stating that they are prepared to guarantee their modified gudgeon pins against failure, provided they carry out the work themselves (price 6s. 6d.).—Ed.]

READERS' IMPRESSIONS OF THE SHOW.

Sir,—After visiting the Show, I should like to give you my impressions. First, I think, the number of women (accompanied and unaccompanied) astounded me, and the majority showed a real live interest in all the exhibits. I hope the manufacturers noted this. Secondly, although an ardent sidecarist myself (and a young one, too), the only thing that interested me at the Show was the Morgan stand. On looking at their price lists, I see none of their models listed above £200, but on a stand near by I saw a two-seater sidecar outfit at £210. I confess it beats me why people buy the latter when they can get car comfort at the same price. The Morgan has got a four-seater; and how nice and comfortable it looks with the hood up!

Concluding, I wish the manufacturers one and all the best of business, and thank them for a nice show.

D. HURREN.

Sir,—I recently came back from the Show, which made me lament my lack of sufficient cash to buy about thirty different 'buses.

I am not really interested in sidecar outfits, but the 8 h.p. Blackburne appeared to be wonderful value for money. It was easily the cheapest high-powered machine in the Show. The makers of the $\frac{1}{2}$ h.p. Quadrant at £100 were another firm offering good value. Firms such as these are helping to bring prices to pre-war level.

Among the solos I was tempted by all the various makes embodying the new J.A.P. lightweight engines. The Raleigh, however, appealed to me, and I finally succumbed to the attentions of the obliging salesman.

The wonderful finish and appearance were irresistible, and the price of £68 put the pot on it. I have therefore substituted Woodbines for my "ten for six pennies" to help pay for the new 'bus.

L. EDWARDS.

Sir,—I should like to write a few impressions of the Motor Cycle Show. When inspecting a machine one naturally likes to ask questions in connection with mechanical effects of new models, especially of new engines, such as oiling system, design of bearings, etc.

These things are illustrated in your journal from time to time, but one does not hear of the test results, and I find, after speaking to several demonstrators, that their knowledge of these details is very limited.

Surely there are readers who will agree with me that one man at least who has been through the workshops (not walked through) should be allotted to each stand.

Southampton.

INTERESTED.

WHICH IS THE WORLD'S BEST SOLO MACHINE?

Sir,—Being a novice, and undecided about the make of my next machine, I have jotted down at some length the reasons expressed by different writers for their preference for various machines. As far as I can make out, however, hardly a single good point has been remarked in the whole discussion which I do not find embodied in my own 'bus—a 4 h.p. Triumph. And now for a brief *résumé* of a few of these points.

"The Indian Scout . . . flexibility and acceleration." With regard to the first point, I could slow down to 4 m.p.h. on top (4.75) and accelerate again from that speed without the least trace of objection in the engine. As to acceleration, I once nearly put myself over the carrier through too sudden opening of the throttle on a 1 in 10 gradient.

The Ariel and Ivy are mentioned for economy. I regularly got over 100 m.p.g., and once did 157 (speedometered), and that in the Lake District.

The Scott is mentioned for silence and top gear performance. Except for the crackle of the open exhaust, I could detect no engine noise. As for top gear performances; I went up Kirkstone Pass on top, and was doing 28 m.p.h. at the top with three-quarters throttle.

Various spring frame steeds are mentioned, but I was always at ease on the saddle even at the end of a 160-mile run.

A.B.C.'s are praised for their easy starting. Mine always started within three kicks without priming.

Nortons are mentioned for speed and power. My 'bus reached just over 55 m.p.h. under normal conditions, and could touch 60 m.p.h. with a slight down gradient or assisting breeze. It is not often that speedmen ever wish to exceed this figure on the road.

Other points mentioned about various makes were torque, balance, non-overheating, ability to take sidecar, and general

TAXI SIDECARS FOR AN INLAND RESORT.

Two well-known Yorkshire competition riders, W. E. Grange and Geoffrey Hill, with their 8 h.p. Rex-Acne taxicab outfits, which they are putting into service at Harrogate. Such machines in time will probably supplant the bath-chairmen of the famous Spa.

and absolute reliability. As far as my experience extends, my 'bus possesses all these points. Transmission excellence is shown by my early statements on flexibility, which even a Sunbeam transmission would find hard to emulate for smoothness.

There is but one point which I am inclined to criticise. Why cannot the machine be supplied with decent handle-bars instead of such awful "ear-scratchers," "sit-up-and-beg," or "sit-down-to-tea," as they are variously termed?

Stockport.

H.₂SO₄.

Sir,—Undoubtedly this is the pre-war Triumph. I started with a 1906 model, battery ignition, and other refinements, and have recently parted with a 1913 machine, having done some thousands of miles in all parts of England. The consumption was 95 m.p.g. regularly, oil negligible, and speed with 4½ to 1 gear over 60 m.p.h. on the road; no speedometer. I have had extensive experience of about sixteen other machines, P. and M. and Velocette included. The P. and M. is the runner up, to my mind, and the Velocette is the best lightweight to be had, but when one is in a hurry 38 m.p.h. gets on one's nerves. I could get 120 m.p.g., however.

One hears a lot about the wonderful new engines, and so on. I have had some, and the old stuff scores every time. Hills made no difference to the Triumph, and the revolutions were something wicked when on the move. I beat a 4 h.p. solo twin easily, geared the same, but with open exhausts fitted. Spare parts are easily obtained. Riding position, accessibility, and its smooth running were a real pleasure. I never had any vibration to speak of on the handle-bars.

The Verus also is good; the 2½ h.p. is a wonder.

London, N.W.3.

KELLY.

Sir,—I feel sure that all Brough Superior riders will agree that when this machine becomes better known there will only be one possible reply to this question. Personally, I am specially impressed by this machine's tremendous power, silky drive, light weight, extreme comfort, ease of control, and magnificent finish. The interest shown by the maker after purchase has to be experienced to be realised.

Scotland.

B.S.

Sir,—Referring to "Harley's" letter, does he really think that the Ford, wonderful production as it is, is the world's best car?

A. F. SCROGGS.

Sir,—With reference to the discussion on the above, I think this is a question that is unanswerable, but perhaps an answer could be found to the question of the best machine for (a) speed, (b) economy on petrol, oil, and tyres, (c) reliability, (d) hill-climbing, (e) accessibility, (f) comfort and appearance, (g) steadiness, (h) cleanliness, (i) silence, (j) brakes, (k) easy starting, and (l) value for money.

In my opinion, the best machines under these headings are as follows: (a) 3½ h.p. 16H. Norton, (b) 2½ h.p. two-speed Douglas, (c) 3½ h.p. Sunbeam, (d) 4 h.p. Triumph, (e) 2½ h.p. A.J.S., (f) 3½ h.p. N.U.T. equipped with Brooks cantilever saddle and Lucas Magdyno lighting, (g) 3 h.p. A.B.C., (h) 3½ h.p. P. and M., (i) 4½ h.p. Humber, (j) 3 h.p. A.B.C., (k) 2½ h.p. 1914 Douglas, and (l) 2½ h.p. A.J.S.

In order to discover the best motor cycle, all the above points would have to be incorporated under one head, and I think that perfection is nearest in the 2½ h.p. A.J.S.

Of course, service from the manufacturers in the prompt despatch of spare parts, if unobtainable locally, counts for a great deal in the selection of an ideal mount.

With reference to "Harley's" letter in your issue of November 24th, I think that the greatest number of machines of any one make on the road would be about equally divided between Nortons, Douglases, and Triumphs, and that American machines of any one make on the road are not so common as the above British makes.

Perhaps Mr. Editor could give us some idea in the matter.

ADSUM.

Hyde Park, W.2.

["Harley's" reference to the number of machines on the road was obviously not confined to Great Britain.—Ed.]

Sir,—I am not surprised to find that my original letter on the above subject has brought forth a great deal of comment, as it is natural that opinions must differ considerably on such a question.

B16

I have carefully read the letters from readers who consider various makes of machine the best; but I have still to be convinced that they are superior to the machine I name. One reader rules out the Sunbeam on the score of price; but, in discussing such a subject as this, I think cost may be put aside.

Another considers that the make of machine most frequently encountered must be the best. If this line of argument be followed, the Ford will undoubtedly be found to be the world's best car!

In some of the letters published, the writers seem to forget the question of workmanship and finish. This point, I maintain, is extremely important. They consider that, because their machines are fairly comfortable, and get them there and back, that is all that is required. I claim that any modern machine should do that.

I will take one or two of the machines named, commencing with the Henderson. The engine has, admittedly, a very even torque, but it certainly is not as accessible as a single. The machine is extremely heavy, and this point alone would rule it out as an ideal solo mount, there being, I should imagine, few persons who would care to ride it without a sidecar. As regards finish, in this it cannot be even compared with the average English machine, much less with the Sunbeam.

The Scott is claimed as best by some, on account of its even torque. Personally, I prefer the beat of a single to anything else.

A. ARNOLD.

[This correspondence is now closed.—Ed.]

VARIABLE PULLEY MANIPULATION.

Sir,—Can any reader tell me how it is possible to get a really low gear on a Philipson pulley without using one's foot, as I have to keep my foot free for the foot brake, which is just about the Philipson? The hand control is of little use in traffic.

Warrington.

CARROTS.

EXHAUST NOTE CHANGES ON TWO-STROKES.

Sir,—With reference to an article recently in *The Motor Cycle* about puzzling troubles, I think I can solve the one about the two-stroke changing its exhaust note. The Velocette I had once had a similar trouble; it would roar away like mad all at once, and then peg out. The trouble was in the B. and B. carburetor, 1915 type, with inverted toggle gear in the float chamber. Apparently the float would bend on the needle and fix it partly open, petrol would flow straight into the crank case, giving a rich mixture, awful petrol consumption, 40 m.p.g. once, and a distinct change in the exhaust, more muffled, due to petrol cutting the oil. The increased friction was negated by the richer and harder pulling mixture. If your correspondent will change his carburetor for one not affected by vibration he will be all right, I expect.

G. ROSEKILLY.

WHERE THE LIGHTWEIGHT SCORES.

This South African motor cyclist evidently thinks discretion the better part of valour, and is taking no risks with his little Cedros in fording the river, preferring to carry the machine and keep his engine running.

PRONUNCIATION OF "MAGNETO."

Sir,—A short time ago I had the pleasure of hearing a first-class lecture on the "Magnetos as Applied to Motor Cars," which I enjoyed thoroughly. The lecturer, however, instead of pronouncing it "magnet-o," as I have been accustomed to hear it, called it the "magné-to," as if it was spelt with two e's (magneeto). Puzzled as to which was right, I looked up my dictionary, but could not find the word, but got "mag-neto-electric," which seemed to suggest that the name should be "mag-neto." PUZZLED.

Harthill.

ROLLER BEARINGS AND THEIR ACTION.

Sir,—Owing to indisposition, my answer to Messrs. A. R. Turner and A. A. Beesley has been delayed. I am perfectly conversant with the working principles of roller bearing big ends.

I should like to point out that (owing to various reasons, e.g., the explosions of the engine and the resilience of metal) the bearing is not comparable to an epicyclic gear.

Also, apart from all arguments to the contrary, the rollers do slip, and, once worn, produce a harsh bearing.

N. A. BLOOMER.

SIDECAR FUEL CONSUMPTION PERFORMANCES.

Sir,—Ignoramus's 92 m.p.g. with Triumph and sidecar (two up) is certainly abnormal, and more than can be expected. However, my feelings are very mixed after reading Mr. H. S. B. Booth's letter, in which he states that several friends and himself cannot obtain more than 55 m.p.g. with the same outfit. The experiences of several friends and my own are very different.

My outfit is an old W.D. Triumph, parts of which are even 1915; Venus sidecar (touring pattern, quite as large and heavy as a Gloria), with Easting screen; my passenger and myself together weighing 17½-18 st. With this outfit thus laden, with usual spares and tyre and tube, I invariably obtain 70 to 75 m.p.g., using B.P. No. 1 spirit. And during the summer when the Easting is not in use the mileage is from 80 to 85 per gallon. Riding solo in summer, I several times got over 100 m.p.g.

This W.D. Triumph is now, and has been since bought, absolutely standard as used by the War Department, and was purchased rough straight off a dump. I have done no tuning or fitting particular "economy gadgets," nor had anything been done to it before.

I claim only to be a careful rider who thoroughly understands his machine, and who regularly attends to adjustments, etc. Also, I am only a one year motor cyclist.

This great disparity in consumption is very strange to my idea, and I hope other Triumph riders will give their experiences and mileage per gallon, particularly some who do not experiment with "economy stunts," etc. I cannot believe that there would be so many Triumph outfits on our roads if they are so expensive to run.

MAHLIB.

Berks.

TAXATION AND THE SAILOR.

Sir,—"Taxation and the Sailor," in your issue of December 1st, is a subject that I have long been waiting to see raised. I entirely endorse "W.A.P.'s" remarks, as I think taxation in this respect is grossly unfair. Personally, I own a 7-9 h.p. sidecar outfit which does a maximum of 300 miles per annum at a cost of £5 6s., in addition to running expenses (£4 registration, £1 ls. Association fee which conscience demands to be paid, and 5s. driving licence). Compare this to the business man, who is on the road perhaps 350 days per year, and I think all will agree that a substantial rebate should be made to members of His Majesty's Forces.

I think this an admirable opportunity for our Associations to prove themselves worthy of the increased subscriptions by taking the matter seriously in hand, as, personally, I know numerous cases amongst Service men where the only thing that prevents them joining the ranks of the motor cyclists is this unfair treatment. What are the opinions of "brother sufferers"?

CORPORAL.

Portsmouth.

Sir,—Although not wishing to deprive any of His Majesty's Forces of the pleasures of motor cycling, is not "W.A.P.'s" method of motor cycling a little foolish? If he only uses his machine for a fortnight a year at most, surely it is

not worth while keeping one, especially as he implies that throughout the rest of the year it is unused. The deterioration of the machine, being left standing, and the little use it is put to, would make motor cycling a very expensive pastime. If "W.A.P." is so keen on the sport, I am sure he could hire a good machine, which has been well-kept, far cheaper than the cost of keeping a machine in idleness for fifty weeks of the year.

CARROTS.

Warrington.

ELIMINATING VALVE CLATTER.

Sir,—I would suggest that the majority of the clatter from a Rudge does not, as your correspondents suppose, come from the inlet valve mechanism only, but is caused by the backlash of the timing wheels, and is noticed particularly when the exhaust cam slides off the rocker. The remedy for valve mechanism silence on a Rudge is to have very close fitting timing wheels, or to block up all holes leading to the inside of the crank case, and fill the timing case with vaseline. My own experiment with the latter procedure resulted in almost complete silence.

MULTI.

Enfield.

SUMMARY OF CORRESPONDENCE.

Referring to a previous correspondent's bad luck with new tyres, "Use Again" (Cove) reports similar misfortune, which, however, he minimised by fitting "detachable endless linings," made by Ripley, Strong and Co., Farnborough, Hants, these giving him an extra 1,500 to 2,000 miles from each cover.

Agreeing with a previous letter on the subject of inequalities in different easy payment systems, "Venus" (Plymouth) also thinks that a much more extended time for completing purchase might be allowed. He instances the three years' hire purchase system for a £50 piano.

Mr. A. Brook writes that the automatic centrifugal cut-out of the Smith generator, recently described in *The Motor Cycle*, is on exactly the same principle as that fitted to the Splittord-dynamo for many years. He also points out to "Ixion" that the Indian motor cycle has had a mechanical lubricating system since 1910.

Two riders of 4 h.p. Triumphs ("OE 7006" and "OH 4471") from Birmingham, who were kindly conducted by a gentleman on a racing Sunbeam from Slough to Olympia on the 3rd inst., wish to thank him for his able assistance and sporting spirit.

Two correspondents disagree with the remarks of B. H. Davies, in his "Open Letter to the Trade," that electric lighting is necessarily expensive. Mr. B. W. King recommends the Wattalite dynamo set, which is sold by Holroyd Motors, 6, Warwick Street, Regent Street, London, W.1; and the Robini Manufacturing Co., of 1 and 24, Tulse Hill, Effra Road, London, S.W.2, state that they market a complete dynamo set, which may be fitted by anyone in one and a half hours, at £15 10s.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

"MOTOR CYCLES AND HOW TO MANAGE THEM."

The standard handbook on the motor cycle.

Price net, 2/6. By post, 2/10

"HINTS AND TIPS FOR MOTOR CYCLISTS."

New Edition. Just Published. Price net, 2/- By post, 2/3.

"TRACING MOTOR CYCLE TROUBLES."

A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.

Price net, 2/- By post, 2/3.

"TWO-STROKE MOTOR CYCLES."

A reliable treatise on Two-strokes, from the rider's point of view.

Price net, 3/- By post, 3/3.

"MOTOR CYCLE REMINISCENCES."

By "Ixion," of *The Motor Cycle*.

Price net, 5/- By post, 5/3.

"THE MOTOR CYCLE" ROAD MAPS.

"THE MOTOR CYCLE" ROUTE BOOK.

With 32 pages of Road Maps. Price net, 5/- By post, 5/3.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

With a Motor Cycle in Bengal

A scene near a native Indian village.

THE touring motor cyclist in India is faced with many difficulties, but there are advantages which are not to be met with in the home country.

Unbridged rivers perhaps constitute the chief difficulty; indeed, the absence of bridges along many of the best roads is possibly the chief reason why motoring tours or long distance journeys are seldom undertaken.

Bengal is a river-ridden province, but the drawback applies very much to India as a whole. Water, which is the delight of the ryot (cultivator), is the curse of India's engineers and motorists. A streamlet may, after a few days' deluge, be turned into a swirling, swollen river as wide as the Thames at London Bridge, and against which no man or beast could stand or swim.

River bridges are the bane of the Public Works Department engineers. It is impossible to get secure foundations on the sandy soil. Some rivers, indeed, have defied the builders, and will possibly never be bridged.

December to February for Touring.

In Northern India the cold season (December to February) is the best time for motor touring, for the reason that the smaller rivers are then all dried up. In the spring months the rivers are a mere trickle of their former selves in an enormous waste of sand, and it is this sand rather than the water that is then the enemy of the motorist. To push a motor cycle and sidecar over the sandy bed of an Indian river and its long, sandy approach, often broader than the river bed itself, is the work of three or four coolies, who push from behind without the aid of engine propulsion and without rider or passenger, and even then the wheels sink deep into the sand until the tyres disappear from view. A car, even when lightened, often requires from twenty to thirty coolies. I have crossed as many as five of these rivers in a day's run,

Some Notes on Motor Cycling Conditions in India.

BY A RESIDENT.

not one of which, including its sandy approach, was less than a mile across. The road usually stops abruptly and continues on the other side. Country carts and pilgrims think nothing of it, but when the river is in flood they take the ferry—usually a frail craft.

Another drawback is the absence of petrol supplies *en route*. In some of the larger towns petrol can now be obtained regularly, but not in all; and cities are to be found where the spirit is not always obtainable. One's stock of petrol and how and where to replenish it constitutes one of the problems of a tour, and the matter must be thoroughly arranged beforehand or the tour will be completely spoilt. Booking petrol tins in advance to railway stations is often resorted to, but there is always the danger of failure of these to arrive in time. Railway stations are frequently some miles away from the trunk roads.

Roads and Accommodation.

The majority of owners here never use their cycles out of "station" (as a town and its immediate district is called), but those who undertake tours will at least have accomplished something and have memories to look back upon for years to come.

The trunk roads, *i.e.*, those connecting big cities, are on the whole well maintained by the Government. They are usually very straight and shaded on both sides with trees to protect pilgrims from the sun, these roads having been laid out some centuries ago, chiefly by the Moghul Emperors.

The problem of accommodation is not so great, for dak bungalows (travellers' rest houses), or P.W. Department's Inspection bungalows, have been established about every fifteen miles on the principal roads and many minor roads. In the open country these bungalows are seldom found occupied, although a room or two may be engaged in those adjacent to the railways and in the towns.

The problem of food is more difficult. A chair, table, and charpoys (string beds) will usually be found at the bungalows, and some have crockery, but everything in the eating line must be taken by the tourist himself. Eggs and the inevitable merghee (chicken) can generally be bought at the villages, but not bread. Sometimes the chowkidhar (Government watchman) will turn out to be a passable cook, and he can always be relied upon to produce boiling water and lamps.

What's Yours to be?

At Least Four-horse? Single? Chain-drive?

THEN you cannot afford to overlook the new $4\frac{1}{4}$ h.p. Beardmore-Precision. At £105 it costs £10—£25 less than other "chain-drivers" of similar power and quality. Yet it has the following exclusive features—that you cannot get on any other machine, whatever it's price:—

Full Cantilever Spring Frame AND

700 x 80 mm. (26in. x 3in.)
"small car" tyres.

598 c.c. $4\frac{1}{4}$ h.p. Precision single
cylinder four-stroke engine
with detachable head.

Automatic and mechanical
lubrication.

Sturmey-Archer 3-speed gear,
clutch, and kick-starter,
built in to engine unit.

All-steel frame of battleship
strength, embodying
pressed steel petrol tank
(holding 2 gallons), large
mudguards and tool-case
as parts of the frame.

Band Brakes to both wheels.

Price - £105

These features mean so much when you look into them that if they cost you more you would still seriously consider them. But they don't. You will have to pay more to be without them!

Grindlay

Sidecars

"For the Rider who will have the best."

Our exhibit at Olympia proved once again that the Grindlay is still the superior sidecar, and represents the best value given in sidecars.

The Grindlay range of models for the coming season is very complete, including models for machines from $2\frac{3}{4}$ h.p. to 10 h.p.. and prices from £17 to £38.

Illustration shows "Club" Model.

If you are in any way interested, write for Catalogue now.

GRINDLAY (Coventry) Ltd.,
Melbourne Works, Coventry.

The New Models are Ready.

The famous Connaught two-stroke is now produced not only in the popular $2\frac{3}{4}$ h.p. model, but also in a super model

$3\frac{1}{2}$ h.p., 3-speed, all chain drive.

This latter model is supplied complete with sidecar and apron for £95

Solo Models from £45.

SEND FOR FULL ILLUSTRATED LIST.

Complete Spare Part List is also ready.

With a Motor Cycle in Bengal.—

Riding should be undertaken in the early hours of the day, and a midday halt of two or three hours be made when the sun is at its strongest. The ride may then be resumed in the cool of the afternoon and the evening. In Northern India it is dark (no twilight) by 6 p.m. in the winter months and 7 p.m. in the summer, but the bungalow selected for the night's stay should be reached by daylight to enable the tourist to look over the tyres and machine, which course will often save a lot of vexatious delay when making the morning start. Night riding on tour is not to be recommended, although a moonlight ride on a "known" road is one of the most pleasant experiences in India.

(Left) In the shade of the palms—a typical landscape of the plains.

(Right) On the banks of an Indian river.

Although the temperature is high, engine heating is not a frequent trouble. Running short of oil and petrol is the chief thing to guard against, because these fuels are absolutely unprocurable in the country, and it is easy to be stranded fifty miles from any place of importance. Friends of the writer went up into the heart of the Senthai Parganas, where probably cars had never been seen before. They stripped the axle of their light car ascending a steep bank out of a river bed and had to "dak" it back for three days, the car being hauled at the rate of about a mile an hour by bullock carts. The party was without food or money and had a trying time, but one to which they can look back all their lives! One hundred miles a day is quite long enough with a motor cycle.

Snakes do not trouble one on the road, although I have ridden over several. I usually trust to speed and lift the feet when passing over. Cattle are a source of endless worry. The cowherds allow their herds to stray all over the roads, and the motorist has constantly to slow down to pass. The cattle remain in the middle of the road until almost touched, and then, with a toss of their hind-quarters, turn and amble onwards in the same direction, still occupying the centre of the road! Frequently they will attempt

a charge from the rear and follow at top speed for quite a distance. A touch of the throttle and a cloud of dust will generally discourage them in this case. Buffaloes, on the other hand, will sometimes charge from the front. The cowherd stands afar off and looks on. The writer once followed a trotting horse for several miles, and could not get him to edge in enough on either side to pass, and feared any moment he might come down in front of the car. No progress could be made if motorists were to dismount and walk past cattle; they are too numerous.

The chief advantages are perhaps the scarcity of motor traffic (one may ride for a whole day without passing another motor), and the long level stretches of straight road on which a high speed could be obtained and maintained were it not for stray cattle. Stretches of fifty miles may be encountered, with the knowledge that no turnings or cross roads are likely to be seen.

Tours can, of course, be made in the hilly districts of India, but the gradients are steep and the heavy rainfall so damages the surface as to make motoring uncomfortable and even dangerous for prolonged touring. Perhaps the United Province is the best district for touring, for the roads are broad and good;

and the province includes the cities made famous in India's history.

A rear sprung frame for motor cycles is desirable, and it is to be regretted that so few of the British makers have studied the Indian requirements in that respect. The Americans are flooding India with cars and motor cycles; the import duty is light and is the same for both British and foreign products.

Capital tours can be arranged with a solo machine by making use of the railways, which carry motor cycles on the mail trains at moderate rates. A night can be spent in a comfortable berth on the train, and the journey continued by road through a different province the following day. The drawback to solo touring is the minimum of luggage and foodstuffs that can be carried, whereas the sidecar will take any amount of luggage and commissariat if there be no passenger.

SPECIAL FEATURES

MISLEADING H.P. RATINGS.
MOTOR CYCLES FOR THE POOR IN
HEALTH.
WITH A MOTOR CYCLE IN BENGAL.

Road Warnings.

At Enfield Police Court recently there have been many summonses against motor cyclists whose machines were not fitted with two independent brakes. There has also been a police trap in operation at the bottom of Red Hill, on the Leicester-Loughborough road, near the former city.

Big Singles.

The popularity of the big single sidecar outfit can be tested any day of the week by a count of passing machines. For 1922, however, the number of makers who list this type is very considerably increased; in fact, odd as it may seem, the sidecar is developing mostly as an attachment for machines of over 550 c.c. and under 350 c.c.

Driving a Circular Saw.

An Irish correspondent has rigged up a motor bicycle for the purpose of driving a circular saw. He takes the drive from the pulley on the gear box to an additional countershaft, whence the drive is by belt to the saw. He tells us that the engine is cooled by dropping water on it.

The London-Exeter Run.

The entry for the annual Boxing Day event of the M.C.C. this year is only four short of 300. Of these 72 enter solo machines, 110 sidecars, 18 three-wheelers, and 95 cars. Among the solo entries there are no fewer than twenty-five whose machines are under 3 h.p.; these include three Ner-a-cars, two Metro-Tylers, two Cedros, two Connaughts, and two A.J.S., and one each Levis, Douglas, Triumph Junior, Velocette, Edmund, Sirrah, Coulson-B, Francis-Barnett, Verus-Jap, Wooler, New Scale, Trump-Jap, Omega, Zenith, and De Dion Bouton, the last-mentioned being B. F. C. Fellowes's ancient mount. Of the 3 h.p. size, there are four A.B.C.'s and one Ivy; while the bigger machines include Triumph, Aleco, Sunbeam, Martinsyde, Douglas, Scott, Norton, Zenith, Zenith-Bradshaw, Rudge, Beardmore-Precision, Brough Superior, Indian, Norton, Raleigh, and N.U.T.

Smallest of the sidecar machines is Neville Hall's O.K. Junior. A 2½ h.p. Orbit, 3½ h.p. Connaught, 3 h.p. Ivy, and 2½ h.p. A.J.S. are also entered; while in this class several new machines make their debut, including the 4½ h.p. Quadrant, 4½ h.p. Beardmore-Precision, and 10 h.p. Champion. Of the eighteen three-wheelers, eleven are Morgans, two Castle Threes, two L.S.D.'s, and one each T.B., Scott Sociable, and New Hudson.

The start is from Staines at 8 p.m., Monday, December 26th, and the first competitor is due back at 5 p.m. the following day.

Times to Light Lamps.

Dec. 15th	...	4.49 p.m.
" 17th	...	4.50 "
" 19th	...	4.50 "
" 21st	...	4.51 "

Number plates to be illuminated thirty minutes earlier, vide Road Vehicles Registration and Licensing Order (1921).

British Supremacy.

According to the A.C.U., 92% of the world's motor cycle records are now in British hands.

A.C.U. Annual General Meeting.

The annual general meeting of the A.C.U. will be held on January 21st at the Royal Automobile Club.

Congratulations.

Our congratulations to H. R. Davies, who was yesterday (December 14th) married to Miss E. M. Jackson. All motor cyclists know him as the winner of the 1921 Senior T.T., and one of the most successful competition riders.

Transmission Free-wheels.

In a recent issue of *The Autocar* was described a transmission free-wheel operating on the same principle as that employed in pedal cycle coaster hubs. The object of this device is to permit coasting automatically on down grades, and thus secure economical running. So far, this scheme has not been suggested by its French sponsors for motor cycle work, but it certainly appears to have its possibilities.

Imports and Exports.

There has been little change in the overseas trading outlook during November, both imports and exports of motor cycles continuing at a low level. Actually, although fewer machines were imported, there is a slight increase in value compared with the October figures. On the other hand, British exports during the same period show a decrease both in number and value—not, however, an unusual tendency in November. Comparative figures extracted from the Trade and Navigation Accounts for November are appended:

IMPORTS.

	Oct., 1921.	Nov., 1921.
Number of motor cycles	39	31
Value of machines and parts	£5,597	£6,226

EXPORTS.

	Oct., 1921.	Nov., 1921.
Number of motor cycles	430	348
Value of motor cycles only	£35,034	£26,794
Value of parts	£26,620	£17,500
Total	£61,654	£44,294

Ex-D.R.s' Reunion.

A small reunion dinner for ex-despatch riders of the 3rd/1st London Divisional Signal Company and attached companies is being arranged to take place in London about the middle of January. Those wishing to attend should communicate with Mr. E. H. McCormack, 8, Leinster Road, Muswell Hill, London.

Another Film.

After the Junior Car Club's dinner, which is to take place on December 21st, a film showing various club events, including the 200 miles race on Brooklands, will be displayed. Light car and cycle car owners will find these pictures of especial interest.

Christmas Holidays.

PUBLISHERS' ANNOUNCEMENT.

Readers who wish to insert miscellaneous advertisements in the issue of "The Motor Cycle" dated December 29th, 1921, should note that, due to the holidays intervening, instructions must be in our hands by first post on WEDNESDAY, 21st inst.

ILIFFE & SONS Ltd.

Revival of the Second-hand Market?

Indications are not lacking that the second-hand motor cycle market is stirring. After two barren advertisements of his 1921 mount at £90, a member of our staff had a round dozen enquiries, and sold the machine shortly after the third advertisement appeared last week. Was a £5 reduction responsible, or is the touch of spring in the air?

Our Enlightened Rural Councils!

"A proposal to round off a dangerous corner has been rejected by the Wing (Bucks) Rural Council, on the ground that it would only induce motorists to go faster. Mr. C. C. Edmunds, Lord Rosebery's agent, urged the Council to add a piece to the corner instead of taking some off, and so compel motorists to go slowly. The Council is considering the suggestion."—A cutting from a local paper kindly forwarded by a reader who wishes us to share his amusement.

Thieves Still Active.

Motor cycle thieves are still very busy, and last Saturday evening the well-known Ivy exponent, Percy Newman, lost his 3 h.p. Ivy outfit from outside the Stonebridge Hotel on the Birmingham-Coventry road. The machine had a very

large tank, and was equipped with an M-L Maglita set, while the sidecar had no door.

Next Thursday's Issue.

Next week's issue of *The Motor Cycle* will be the Christmas Number. As usual,

we shall permit ourselves the relaxation of dealing with a number of matters in a lighter vein, and the customary illustrated short story with a motor cycle flavour will not be lacking. The usual features of topical and technical interest will, of course, be maintained.

**G.P.O. ENTERPRISE IN THE ANTIPODES.**

A fleet of B.S.A. machines which were recently delivered to the Postmaster-General's Department in Australia.

RENEWAL OF LICENCES.

MOTOR cyclists should apply for renewal of their existing licences as early as possible after December 16th, in order to assist the authorities concerned in dealing with the large numbers of applications which will be received.

It is estimated by the Ministry of Transport that over 800,000 licences for mechanically-propelled road vehicles will expire on December 31st, most of which will be renewed for the quarter or year commencing January 1st, 1922. It will be realised that this work of renewal, together with the issue of licences taken out for the first time, will throw a great strain upon the staffs at the local taxation offices, which have been kept down to the lowest possible limit in order that as much money as possible should be available for the construction and maintenance of roads.

The public can materially assist in the work of renewing licences:

- (1.) By ensuring that their applications for renewal are in order, thus saving much correspondence; and
- (2.) By applying for renewals on December 17th, or soon after, and so avoiding congestion at the last moment.

Renewals can be effected at a principal post office, except in the following cases:

If there has been a change of ownership since the last licence was taken out.

If the old licence expired more than fourteen days previously.

If it is desired to change the classification of a vehicle, e.g., from "commercial goods" to "hackney."

A postmaster can only issue an annual licence for 1922 in renewal of a *blue* licence for 1921.

The following must accompany an application for renewal.

(a) A renewal form "R.F.1/a" duly filled in.

(b) The registration book for the vehicle.

(c) The old licence (in the case of post office renewals only).

(d) The amount of duty.

Personal attendance at the post office is necessary, either of the licensee himself or of his representative, but application for renewals to county and county borough councils may be made either personally or through the post.

If the applicant did not take out the last licence, he must be sure that the change of ownership has been entered in

the registration book, and that the council has noted the change by date-stamping the ring against the new owner's name on pages 3 or 4 with the council's date stamp. If this has not been done, the council should be written to immediately.

The new licensee must take or send to the council:

(a) A full declaration form (obtainable at any Money Order Post Office), *not* a renewal form "R.F.1/a."

(b) The registration book for the vehicle.

(c) The amount of duty.

The new licensee, where there has been change of ownership since the last licence has been taken out, or where he desires to register under a new class, should ask the postmaster of the nearest Money Order Post Office for the appropriate declaration form: in the case of motor cycles, "R.F. 1/2."

With regard to motor cycles registered in the early part of 1921, the engine number and frame number must be inserted on page 2 of the registration book before renewal can be effected, and the renewal can only be effected at the Council's offices, and *not* at a post office.

A THREE-WHEELER AS A DELIVERY VAN

The sturdy construction of the L. S. D. lends itself admirably for the purpose of a trade vehicle, as will be seen from the illustrations. A body of ample size is provided.

A.C.U. General Meeting at Bournemouth.

Tourist Trophy Races Again in the Isle of Man. Horse-power Ratings to be Standardised. Changes in Stock Machine and Six Days Trials.

NO such momentous decision as that arrived at on the occasion of the last A.C.U. committee meeting at Leicester marked the general meeting at Bournemouth on Saturday last, for it was a foregone conclusion that next year's T.T. races would be held in the Isle of Man as heretofore.

Provincial meetings are to be abandoned, a technical sub-committee is to be formed to settle the question of horse-power rating of motor cycles, and certain information came to light concerning the next stock machine trial and the 1922 A.C.U. Six Days event.

After the secretary had read regrets of absence from several members unable to be present, reports of various management and competition committees were received. In connection with the former, the Chairman reported that the Union had taken strong action as regards the question of motor cycle number plates, which has been under consideration by the Ministry of Transport, and that attention had been given to the re-organisation of the staff. He also reported concerning the joint conference between the A.C.U. and the R.A.C. Originally, the former body paid the latter 2s. 3d. per head for such facilities as touring, legal assistance, etc. It was then asked to pay 5s., as the 4s. offered was found to be inadequate. These facilities cost the R.A.C. 7s. The A.C.U. was unable to pay more, and an *impasse* was arrived at. At the joint conference the matter had proceeded most happily, the 4s. offer was accepted, and the R.A.C. agreed to make up the deficit to its General Committee. He also stated that the A.C.U. Management Committee had a card up its sleeve which would secure it greater benefits. Mr. Otto Thomas explained the matter further, and the Management Committee reports were then passed.

Trial Matters.

A lengthy discussion followed on the question of the Reliability Premiership. Mr. S. R. Axford complained that the Competitions Committee did not see the scheme through, and proposed that the report should not be adopted. The Chairman, Col. F. S. Brereton, suggested that the winners of the Centre Competitions for the Premiership should have a free entry in the next Six Days Trials. This was agreed to, and Mr. Axford's motion was lost. Proposing the acceptance of the Competitions Committee's report of November 24th, Mr. Reynolds mentioned that the present system of controlling records had not been found to be ideal, and that a sub-committee had been formed to go into the matter and to investigate the methods of timing. There had been a proposal from the Midland Centre to the effect that no A.C.U. steward or judge should have any connection with the trade, and this matter was deferred till the next General Committee meeting. The next item referred to the 1922 Six Days Trials, *à propos* of which Mr. T. Rutherford had formulated a scheme whereby the competi-

tors would wear armlets denoting the class of medal for which they were eligible, which would be changed as they lost marks, and thus would indicate to the general public how they were faring throughout the trial. This scheme, however, was not adopted. Mr. Reynolds then went on to explain that it was proposed to call in the help of the Centres in the 1922 Six Days Trial. It was proposed to start, say, from York, and visit such places as Matlock, Shrewsbury, Llandrindod Wells, and Gloucester, and finish at Brooklands. It was decided to present a cigarette case to the late Competitions Committee chairman, the Rev. E. P. Greenhill, in recognition of his long association with the Auto Cycle Union. Mr. Reynolds then announced that the trial of stock machines would start from Birmingham, and finish at Brooklands.

The T.T. Races.

Arising out of the statement that next year's T.T. races should be held under the same rules as last year, Mr. E. M. P. Boileau asked if the 250 c.c. light-weight machines might now be regarded as running in a separate race concurrently with the Junior T.T., and not merely as a subsidiary class.

Mr. A. G. Reynolds, who proposed the adoption of the Competitions Committee reports, replied that adequate publicity would be given to the leaders—as much, in fact, as to the leaders in the Junior race.

Mr. S. L. Bailey suggested that the tyre size limits in the Senior T.T. should be increased to 65 mm.; but it was decided not to adopt this, and it was pointed out that the F.I.C.M. imposed a minimum tyre size which manufacturers were at liberty to exceed.

Mr. G. J. A. Brown (the Manx M.C.C.) was then asked to make a report concerning the arrangements for next year's Tourist Trophy races. The dates, suggested Mr. Brown, were Tuesday, May 30th, and Thursday, June 1st. The practice hours could be arranged to the mutual satisfaction of the A.C.U. and the Manx authorities. It had been arranged with the Douglas Corporation that the playing fields should be offered to the A.C.U. for the enclosure free of all charge. Improved steamship services would be running throughout the practice period (two services by day and one by night). Five thousand pounds had been voted by the Tynwald Court for the erection of an electric crane on Douglas Pier, and a wide gangway would be used on the Liverpool landing stage, up which a sidecar outfit could be easily pushed. The tax illegally exacted last year from visiting motorists would be abandoned, and all which would have to be paid was 1s. for registration. A list of hotel charges would be prepared, pillion riding would be allowed, and there would be no ban on Sunday motoring after 9 a.m. The question of a subsidy or a guarantee was next discussed, and it was finally decided that the I.O.M. authorities should be requested to pay the police and doctors.

The Manx Club also consented to continue their efficient marshalling during practice. It was then agreed that the 1922 T.T. races should be held in the Isle of Man, and the Chairman offered his thanks and congratulations to Mr. Brown for all he had done.

Next the Secretary made certain statements in connection with the drawing up of the annual report. The membership, he said, had been reduced, but the Union's revenue had increased, and it was now on a sound financial basis. Many records had been confirmed, and now showed that 92% world's records were in British hands. He also mentioned the Union's legislative work, its influence on the 1920 Road Act, and on the new number plate proposals. The centre scheme had greatly progressed, and this year the A.C.U. Touring Department had issued 4,200 English routes, 500 Continental routes, and 500 Customs papers, while the A.C.U. touring representative had covered 11,000 miles.

Mr. Quintin Nicol proposed that a brief account of each centre's work should appear in the report. This was agreed.

Competition Finances.

In the course of discussing the balance sheet it was decided that figures should be prepared showing the profit and loss on various competitions, taking into consideration a certain percentage of overhead charges. The balance sheet was then approved.

It was decided to hold the A.C.U. annual general meeting at the Royal Automobile Club at 3 p.m. on Saturday, January 21st. The existing president and vice-presidents would be nominated for re-election at this meeting.

Mr. S. R. Axford's proposal to the effect that A.C.U. General Committee meetings should be held in future in London was briefly discussed and agreed. Mr. Axford's second proposal, "That in view of the conflicting and valueless horse-power rating of motor cycle engines the A.C.U. should standardise some nominal rating, say, 1 h.p. per 100 c.c." This was agreed to in principle, and it was decided that the matter should be referred to a special sub-committee, consisting of Mr. S. R. Axford, Dr. A. M. Low, Messrs. E. M. P. Boileau, J. W. G. Brooker, and E. B. Ware.

Mr. Featherstone's proposal that all profits accruing from the centre open event should be divided between the centre and all clubs in the centre *pro rata* to its membership was regarded as a purely domestic matter, and was withdrawn.

The following clubs were affiliated to the parent body: The Chester and District, the Kingswood and District, the Harrow and District, and the Hinckley and District Motor Cycle Clubs.

The meeting, which began at 10 a.m., continued with a brief interval for lunch until 2.30 p.m.

The previous evening a dinner was held, at which the Mayor, the principal Bournemouth civic officers, and many local motor cyclists were present.

CLUB NEWS.

Worcester and District M.C.C.

On Wednesday next the annual general meeting of the club will be held in the Pack Horse Hotel, Worcester.

Herts M.C. and L.C.C.

The first annual dinner was held recently at headquarters, some sixty members and their friends being present. Trophies, etc., won during the season were kindly presented by Mrs. Plowman.

Essex M.C.

Two important dates in the competition programme for next year of this club have already been fixed. A one day trial will be held on February 18th, and a hill-climb on March 25th. These events are, of course, confined to club members.

Ipswich and District M.C.C.

On Saturday, 26th November, the club held its first annual dinner, at the Great White Horse Hotel, Ipswich. About a hundred members, who were accompanied by friends, sat down to a very excellent dinner, which was followed by a smoking concert and distribution of prizes on the conclusion of a most successful season.

South Midland Centre A.C.U.

This centre, which is showing signs of great activity, and has arranged a very comprehensive programme for next season, is holding its annual general meeting at the Red Lion Hotel, Bedford, on December 18th, at 1.30 p.m. Lunch at 12.30 p.m. for those who desire it. All members of clubs in the South Midland Centre are entitled to attend.

Leeds University M.C.

On Saturday, November 25th, the club held a point-to-point reliability trial over a forty-mile course for the Moore Trophy. A good knowledge of map-reading was essential, as all time wasted in finding the checks had to be made up on a 20 m.p.h. average.

A. F. Plummer (3 A.B.C.) proved to be the winner, with R. Gosling (3 A.B.C.) a close runner-up, followed by G. Suddards (3½ Rudge).

Winter Social Events.

Thursday, Dec. 15th.—Redditch and District M.C.C.

Annual Dinner.

Friday, Dec. 16th.—Bradford M.C. and L.C.C.

Annual Dinner.

Saturday, Dec. 17.—Wallington and District M.C.

and L.C.C. Annual Dinner.

Monday, Dec. 19th.—Barrow and District M.C.

Annual Dinner.

Wednesday, Dec. 21st.—Junior Car Club. Annual

Dinner.

Friday, Dec. 23rd.—Cumberland County M.C.C.

Annual Dinner.

Glasgow University M.C.C.

Membership of this new club is open to past and present members of the Glasgow University. The hon. secretary is Mr. J. C. Todd, the Union, Glasgow University, Glasgow.

Central London M.C.C.

Owing to lack of support, this club has amalgamated with the North West London M.C.C. A prize, to be called the Central London M.C.C. prize, will be awarded in an event next year.

Midland Centre A.C.U.

In the recent West Midland open reliability trial, the following additional awards have been announced: G. Strange (3½ James) and G. Butcher (3½ Sunbeam), gold medals; G. Packman (8 Matchless sc.), silver medal.

TO CLUB SECRETARIES.

"The Motor Cycle" Film is now being loaned to enterprising clubs which are keen to make their winter social events a success. This exclusive film takes about forty minutes to exhibit, and the programme includes scenes at the Junior and Senior T.T. Races, the 500 Miles Race, the Six Days Trials, the Grand Prix Car Race, and the 200 Mile Small Car Race. Club secretaries should write to the Editor (Film Department), "The Motor Cycle," Coventry, suggesting two or three alternative dates, preferably in April or later in 1922.

"THE MOTOR CYCLE" FILM.

SINCE its provincial release on Monday, December 5th, *The Motor Cycle* film has been shown in six different places—Coventry, Cheltenham, Gloucester, Stafford, Rednal, and Birmingham—and in each case has been received with great enthusiasm.

In this connection we give below extracts from letters received from the secretaries of two of the clubs responsible for the arrangements. Mr. Frank R. Ware, of the Gloucester M.C. and L.C.C., writes:

"The film was exhibited at the Empire Theatre to crowded houses, and was greatly appreciated and very well received by motor cyclists and non-motor cyclists alike. We think it an excellent film, and one of which those who were responsible for getting it together might well be proud. Those motor cyclists who were not fortunate enough to see the events depicted in the film had a great treat, and we feel sure that this film will do

good to the promoters and to motor cycling generally. We would like to express our heartiest thanks for the loan of the film, and to those individuals in whose minds the idea was worked out and brought to such a happy issue."

Mr. J. F. Spencer, hon. secretary of the Coventry and Warwickshire M.C., sent the following acknowledgment:

"I am writing to congratulate you on the excellent film shown at the Empire. I was present on Tuesday evening, and thoroughly enjoyed the thrilling sight of the T.T. and other events."

Glasgow and Worcester Next.

To-night the Western M.C.C. (Glasgow) will give Scottish motor cyclists their first opportunity of witnessing this comprehensive screen record of the important competitions of 1921. It will be exhibited at the Cinema House, Renfield Street, Glasgow, to-day, to-morrow, and Saturday.

Croydon and District M.C.C.

Under the direction of Messrs. H. R. Davies and Harry Martin, the success of a new club, as above, should be assured. Fuller particulars may be obtained from Mr. A. J. Winstanley, 53, South End, South Croydon, Surrey. Telephone: Croydon 2431.

Surbiton and District M.C.C.

A distinguished gathering of motor cyclists enjoyed a most entertaining evening on Wednesday, December 7th, at the Holborn Restaurant, London, on the occasion of the second annual dinner of the club. Dr. A. M. Low, A.C.G.I., D.Sc., was in the chair. The absence of the customary detailed list of toasts, and the impromptu manner in which the more serious proceedings were conducted, lent a most pleasant atmosphere to the evening. Mr. T. O. M. Sopwith, during a most amusing speech, paid a tribute to the club, and made reference to the phenomenal success it has attained during its brief existence.

It was suggested that a booby prize in the form of a pogo stick should be awarded to the competitor who gained the least marks during the season.

Mr. Alec Ross extended his congratulations to the Surbiton Club on its unique success, pointing out that the membership embraced riders of the highest order, both in road competitions and on the track.

The awards, which included some magnificent cups, were distributed by Mrs. T. O. M. Sopwith.

Mr. Kaye Don, a very popular member, was, much to his astonishment and confusion, chaired by his many admirers after receiving his awards; and Mr. Davidson, whose performance in the Sopwith Cup trial was remarkably good, received a similar ovation, and was carried shoulder-high down the centre of the room.

Motor Cycling Club.

The annual general meeting will be held at Pagani's Restaurant, Great Portland Street, London, W.1, on January 31st.

On Monday the Worcester and District M.C.C. has arranged for its exhibition at the Silver Cinema, Worcester; and here again, since the club made a very early application, it will remain for three days. Owing to the great demand, it has been found impossible to allot more than one day to the majority of clubs which have booked later dates.

Below is a diary of the exhibitions until the end of the year:

Thursday, Friday, and Saturday, Dec. 15th, 16th, and 17th.—Glasgow Western M.C.C.

Monday, Tuesday, and Wednesday, Dec. 19th, 20th, and 21st.—Worcester and District M.C. and L.C.C.

Friday and Saturday, Dec. 23rd and 24th.—York and District M.C.

Wednesday, Dec. 28th.—Yeovil and District M.C.

Thursday, Dec. 29th.—Truro and District M.C. and L.C.C.

Friday, Dec. 30th.—Falmouth M.C. and L.C.C.

Forty-eight other clubs have been definitely allotted dates, and the total number of enquiries received totals well over one hundred, including two from the Continent—Rotterdam and Liège.

Motor Cycle Practice in a Four-wheeler.

Chain Drive, Side-by-side Seating, and Wider Track for the New Tamplins.

THERE are many big sidecar outfits that are more complicated than the latest chain-driven Tamplin four-wheeler, which, nevertheless, follows strictly motor cycle lines.

As on the belt-driven model, an 8 h.p. J.A.P. and a Sturmey-Archer gear box are fitted, but the chassis and bodywork have been entirely redesigned, resulting in a remarkable improvement in appearance. The chassis is built up of angular section rolled steel, and the solid back axle is carried in Skefko ball bearings, the housings being mounted between each spring and flat radius rod.

The kick-starter is so arranged that the pedal may be conveniently operated from the driver's seat, and the direct steering is of the Ackermann type. Internal and external brakes on the one drum (on the rear axle) are standard. The springing is by quarter-elliptics at both front and

So effective are the simple lines of the new Tamplin that it is difficult to realise that it is more akin to the motor cycle than to the motor car.

Showing the rear springing, brakes, and transmission details, including the gear box mounting, of the 8 h.p. Tamplin. The chassis is built up of L section steel.

rear, and the movement of the axles is controlled by flat radius rods.

Transmission is by chain throughout, one chain running from engine to gear box, and another from gear box to back axle. Both gear box and engine are centrally mounted on a longitudinal member carried by the chassis cross pieces.

Attractive Coachwork.

Quite roomy and well finished, the body compares favourably in its well-balanced, attractive outline with cars costing three times as much as the £175, which is the provisional price of the new Tamplin.

The makers are Tamplin Motors, Ltd., Kingston Road, Staines.

A Dual-purpose Tricycle.

Simplicity in Construction. Convertible Bodywork.

THE motor tricycle was the first practicable form of the motor cycle, and it has still many advantages to recommend it, either as a tradesman's carrier or a passenger vehicle. That it is possible to design a tricycle with a greater economy of material than is the case with the sidecar outfit is well illustrated in the Dobbin tricar, an American production intended to serve the dual purpose of light delivery and the transportation of three persons. In the form illustrated, as a pas-

senger machine we can imagine it in use by farmers in the outlying districts of America, but in this country it would not be regarded with much favour; lower bodywork, however, might be fitted.

As will be seen from the illustrations, simplicity of construction is the keynote of its design, the frame being of pressed steel, which, incidentally, forms the tank; the

forks, too, are of steel pressings. The engine is a single-cylinder air-cooled two-stroke, having a bore and stroke of 88.9 x 88.9 mm., the capacity being 550 c.c. A two-speed gear forms part of the engine unit, and the transmission is by chain direct to a differential rear axle. The makers are the Dobbin Motor Co., 424, West Broadway, New York.

A double-purpose tricycle, made by the Dobbin Motor Co., of New York. The rear seat can be quickly detached and replaced by a box body of ample proportions. The engine is a 550 c.c. two-stroke, carried on a pressed steel frame.

A CHANNEL STEEL CHASSIS.

The Robson Sidecar, from which Brazed Joints are eliminated.

A VERY simple sidecar construction, unconventional in chassis design, springing, and couplings, has been evolved by S. T. Robson, Ltd., of 275-277, Coventry Road, Birmingham.

The main frame of the chassis is a truncated triangle (with rounded corners) made of channel steel in one piece, the ends being welded together. To this member the axle tube, front cross-bar, and front connection tube, are attached by U bolts or similar clips.

Steel plate connections for the Robson sidecar; they embrace two of the motor frame tubes in each case.

Swinging on the axle and cross member are bell cranks, tied together at their lower extremities by flat steel connecting links. The upper ends of the cranks carry the bearer bars for the body, and the motion is controlled by long tension springs, which have screw adjustments to their anchorages. It will thus be seen that the body is parallel with the ground throughout the range of its springing movement, unlike the usual sidecar body, which is usually pivoted (more or less flexibly) at the forward end.

Three points of attachment are provided, and the frame clips on the motor cycle are built up of sheet steel, and two of them are so arranged as to grip two tubes. A wide range of adjustment is provided by the clips, and it is noteworthy that the attachment of the side-

Lightness and simplicity in sidecar construction.

One-piece channel steel chassis of the Robson sidecar, showing the parallel link motion coil springing.

car axle to the back stays of the motor cycle is a trailing universal joint, which allows a certain amount of flexibility.

Almost any type of flat-bottomed body may be fitted on to this chassis; and, owing to the fact that the springing is entirely underneath the floorboards, the width of the chassis is kept within reasonable limits without cramping the body room.

A 75 lb. LIGHTWEIGHT.

The 142 c.c. Atlas, with Single-speed Countershaft, selling at £31 10s.

THE aim of the Aston Motor and Engineering Co., Ltd., Witton Lane, Aston, Birmingham, in producing the Atlas lightweight was, frankly, to make a runabout suitable for short business or pleasure journeys where a pedal cycle would otherwise be used.

Interconnected hand and foot brakes are fitted

This has been most successfully accomplished, and the resultant machine, with its sturdy, compact, and clean lines, immediately strikes one as being capable of doing even more than the manufacturers claim. It will be sold at £31 10s., and should be both economical and handy.

Of the usual three-port type, the two-stroke engine has a bore and stroke of 55x60 mm. (142.5 c.c.). Plain bearings are fitted, except to the inside of the mainshaft, which is mounted on a Hoffmann race, and the flywheel is of sufficiently large diameter. A double sprocket is fitted, which drives both the magneto and the countershaft, the chains being protected by a single cover, and lubricated by surplus oil from the release valve. The countershaft runs on ball bearings.

Brakework has been carefully and ingeniously carried out. Both shoes operate on the belt rim. The foot brake is heel-operated, and the hand brake by cable from the handlebar, which, when sufficient pressure is used, connects up both shoes. Thus a very gradual and sure pull-up may be effected by the inverted hand lever.

Lubrication is by petrol, and a fuel consumption of 240 miles per gallon has been obtained. Well-known components are used for carburation, ignition, etc., and the mudguarding (4½ in. guards) is well carried out.

Altogether, the Atlas is one of the most promising ultra-lightweights we have encountered, and at the low price at which it is offered excellent prospects should lie before it.

Although weighing only 75 lb., the Atlas lightweight is an exact miniature of much larger and more powerful machines.

SILENCING WITHOUT LOSS OF POWER.

SOME remarkable claims are made for the Carb-jector silencer, and undoubtedly the device is an excellent solution of the problem of noise reduction without loss of power. At least one well-known machine (the Velocette) will be fitted with it as standard for next year.

As the name implies, an ejector action is used. Referring to the sectional diagram, the waste gases entering the silencer are split up. Some strike the diaphragm

and rush down the ever-widening outside spiral passage, being cooled, expanded, and stabilised in the process. A thin

Sectional diagram of the Carb-jector silencer. The gases enter at the left-hand side in this drawing.

stream, however, continues down the narrow central passage, which at its nozzle acts as an ejector for the gases, leaving the spiral portion. Such is the theory of the device.

In practice it most efficiently silences the exhaust note, causes no more back pressure than an open pipe, and ejects the gases in a semi-cold state.

The makers are Bridgehead, Ltd., Bankhey Works, Blackpool.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

EFFECT OF LIGHTER PISTON.

? Concerning the balance of my engine, a 1911 $3\frac{1}{2}$ h.p. T.T. Triumph, I sent for a new cylinder piston and connecting rod, and, after assembling and having a trial on the road, I find there is much more vibration now than there was before. I have taken the engine down again, and, on weighing the old piston and rod and the new piston and connecting rod, I find that the new piston and connecting rod are $4\frac{1}{2}$ ounces lighter than the old ones. I wrote to the makers, and told them of the difference in weight, and they advised me to remove four leads from the flywheels, but I am still in doubt as to what part of the flywheels from which to remove them.—A.S.

Take the lead from the flywheels on the sides opposite the crank pin; remove an equal quantity from each wheel.

EFFECT OF WEIGHT INCREASE ON TAXATION.

? I own a lightweight motor cycle, the weight of which is registered as 130 lb. My present tax is 30s., and I have to re-declare the machine prior to renewal of licence; but, having fitted an Albion gear box and various other parts, the weight must now considerably exceed 130 lb. What is the maximum weight allowed on present assessment?—H.H.B.

If the weight of the machine does not exceed 200 lb., the tax will be 30s.

OVERHEATING WITHOUT APPARENT CAUSE.

? After recently taking down my 1920 Villiers two-stroke engine for decarbonising, I now find that it gets hotter in half a mile than it previously did in twenty miles. It overheats very quickly. Firing is in order with points just opening when piston is at top dead centre, spark lever in retarded position. I can find no air leaks in crank case or carburetter and plug, and compression is good; petrol pipe, jet, etc., are quite clear. No alterations whatever have been made, except to replace crank case washer with one which was a trifle thinner. Petrol system of lubrication has always been used with engine with the best of results. The engine has not lost power through overheating.—H.J.W.

If the power remains as before, and if the fuel consumption is no worse than

formerly, the hotter running of the engine may be disregarded. From your description everything appears to be in good order mechanically, and, therefore, it is impossible to deduce a reason for the difference in running.

A WIND WAGGON.

? (1.) Will a 4 h.p. (595 c.c.) Douglas flat twin engine give sufficient power to propel a two-seated wind wagon? (2.) What size of four-bladed propeller would be most suitable for this size of engine? (3.) In order to diminish the size of the propeller, would not one with five or more blades be practicable? (4.) Is aluminium a suitable material for a propeller? (5.) Of what pattern are the bearings of 700x100 mm. aeroplane wheels? (6.) When a tyre is stated to be a 700x100 mm. size, does this mean the actual wheel diameter, or the diameter of the tyre at the tread? (7.) Is duralumin a patented material, and can you tell me of a firm that makes it? (8.) How does the above metal compare in price with aluminium? (9.) How much are wind waggon taxed? (10.) Must a petrol tank be above an engine to feed the carburetter? If the tank were below the engine, would not the

engine suction feed the carburetter? (11.) I propose making the chassis of $2\frac{1}{2} \times 2\frac{1}{2}$ in. ash wood. Is this strong enough?—A.W.S.H.

(1.) It is very doubtful if such a small engine would answer the purpose except on level roads. (2.) A four-bladed propeller would be most suitable. (3.) No. (4.) Wood made up in several laminations is the only satisfactory material. (5.) Plain bushes. (6.) The figures given are the tyre dimensions, not the size of the wheel rim. (7.) Yes; Vickers, Limited, Broadway, Westminster, S.W.1. (8.) We have not the prices before us in very small quantities; the cost would probably be prohibitive. (9.) As all other four-wheeled motor cars, on the R.A.C. rating of the engine. (10.) If the petrol tank is below the carburetter, you must use either a pressure feed system or a vacuum feed such as the Autovac. (11.) There is no need to use square wood for your chassis. $2\frac{1}{2} \times 1\frac{1}{2}$ in. should be sufficient for the side members.

BLOWBACK THROUGH CARBURETTER.

? My 1914 6 h.p. Rex pulls well, and everything seems in order; but on the road a vapour continually blows out from the carburetter. I can only do about 30 m.p.g.—C.S.

You do not give sufficient details, but we imagine that the trouble is chiefly due to the inlet valve springs being weak. Renew these with stronger ones, and also make quite sure that the exhaust valves are not closing too early. Early closing of the exhaust valves may be due, of course, to worn timing gear, or more likely to excessive clearance at the exhaust valve tappets.

DULL-PLATING CYLINDERS.

? Can you tell me where I can get a Triumph cylinder plated, as the Indian people used to finish their cylinders? This finish has always appealed to me, but I do not know whether it is done with success over here, and should, therefore, be much obliged if you could say who would do this. Is it really a lasting finish, and what is the approximate cost? My doubts as to its real value are strengthened by the fact that so very few engines are so treated.—H.G.K.

Almost any electro-plater should be able to plate your cylinder if you wish to have it done, but we cannot give you any idea as to the cost. Apart from appearance, there is no advantage.

Important Dates.

Mon., Dec. 26th, Tues., Dec. 27th—M.C.C. London-Exeter-London Trial.

Sat., Dec. 31st—N.W. London M.C.C. Twelve Hours Open Winter Trial.

Fri., Jan. 27th, to Sat., Feb. 4th, 1922—Scottish Car and Motor Cycle Show.

Sun., Mar. 5th, 1922—Argenteuil Hill-climb (France).

Mon., Mar. 6th, 1922—La Turbie Hill-climb (Nice).

Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.

Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.

Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.

Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.

Fri., April 14th, and Sat., April 15th—M.C.C., London-Land's End Run.

Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.

Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.

Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.

Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.

Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.

SIDECAR FOR A TWO-SPEED "31."

? I possess a 1918 model P. and M. motor cycle, to which I desire to attach a touring model sidecar, and should like your advice.—F.W.B.-N.

Any standard sidecar not exceeding 110 lb. in weight should suit your machine. With the comparatively small power and small choice of gear ratios available, you must appreciate that the machine should not be overloaded. Probably your best plan would be to obtain the standard sidecar produced by the makers of the machine, as there would then be no difficulty in fitting, all the connections being made to suit the sidecar lugs on the motor cycle frame.

PERFORMANCE OF SINGLE AND TWIN.

? Reverting to the lecture on "Comparative Motor Cycle Performances," reported in *The Motor Cycle* some little time ago, and as an absolute novice in all things appertaining to motor cycles, I may have misread what the lecturer purported to illustrate; but regarding the performances of a 6 h.p. twin and a $4\frac{1}{2}$ h.p. single my summary of the two machines is as follows: 6 h.p. Twin Sidecar.—Maximum speed, 45 $\frac{1}{2}$ m.p.h.; top gear, climbs 1 in 14; second, 1 in 8; and third, 1 in 4. $4\frac{1}{2}$ h.p. Single Sidecar.—Maximum speed, 43 m.p.h.; top gear, climbs 1 in 12 $\frac{1}{2}$; second, 1 in 6; third, 1 in 3. To my mind, except for a trifle in speed, the $4\frac{1}{2}$ h.p. single is the superior for all-round work. What then are the advantages claimed for a twin? One would have thought that an extra 2 h.p. would have made the twin much faster and a better climber. I am contemplating purchasing a motor cycle, but these comparisons bother me, especially when there is such a difference in price without apparently any gain in performance between the twin and the single. One more query. Is there a "best speed" at which, say, any single, with sidecar, should be driven? The maximum as given above is 45 m.p.h.; but no ordinary driver wants that, neither under ordinary touring conditions does he want the machine to be "slacking." There must be a speed at which everything is working in harmony; pulling sweetly without undue strain and with a minimum of wear and tear and so on. Will you enlighten me upon these points?—ALVERSTONE.

Your figures are approximately correct, but it is not right to say that the performance of the two machines is in every way equal. In the example you quote, the 6 h.p. outfit weighed 170 lb. more than the $4\frac{1}{2}$ h.p. machine, and this extra weight is made up by using a much larger sidecar and detachable wheels, larger tyres, and similar refinements. Even if the maximum speed and climbing ability of the twin is no better than that of the single, there are other advantages, such as smooth torque, and also the possibility of maintaining a higher average speed owing to the smoother running of the twin engine. The "most comfortable" speed of the average single is probably about 22-25 m.p.h. (with sidecar); while the twin may be driven almost indefinitely at 30 m.p.h. without any feeling of overdriving the engine.

SLUGGISH RUNNING AFTER REPLACING ENGINE PARTS

? A 1918 2 $\frac{1}{2}$ h.p. Douglas, recently purchased, was a very fast machine, capable of taking any hill up to 1 in 12 on top; but at speeds exceeding 25 m.p.h. the vibration was bad. This gave me the impression that the big ends were loose, and, after examination, I found that the crank pins were badly oval. I decided to get a new crankshaft (and, incidentally, to get twin piston rings.) Everything conceivable has been done to get the engine in perfect trim. Now, though there is no vibration in running, the machine behaves in a most disappointing manner. It is extremely slow in acceleration, and, unless given a good start, will hardly go up a small incline on top gear; and as for speed, 25 m.p.h. is the maximum. The compression is good, and the magneto is a new C.A.V. The timing seems correct, the points just opening over the top centre. The new crankshaft was fitted recently, and the distance covered since about 150 miles. The bearings seem free, without excessive play.—D.F.

It would appear that in reassembling your engine either the valve or ignition timing has been erected wrongly. The valve timing can be checked by the marks on the gear wheels, and the ignition timing should be set so that the magneto points are just breaking with the control lever two-thirds retarded and the piston on top dead centre. The new piston rings may take 200 or 300 miles to "run in," and until that distance has been traveled the engine may run a little stiff.

SIDECAR OR THREE-WHEELER.

? On reading "Three-wheeler's" recent letter to potential cycle carists, I was rather surprised at some of his remarks. I was thinking of something in that line myself, but, being a family man, and not over blessed with riches, I want to know a few little points definitely before making a change. My present outfit, a $4\frac{1}{2}$ h.p. single, takes my wife, self, and two children anywhere, but it lacks comfort, and we are unable to converse with ease while

running. Now what I want to know is: (1.) Why will not a three-wheeler carry more than two? (2.) Where does the extra insurance and tax come in? (Garage would make no difference to me.) (3.) Why is depreciation so high? (4.) Why car charges for repairs, overhauls, accessories, and spares?—CANNOCK CHASE.

(1.) It is usually rather difficult to arrange for increased seating capacity on a three-wheeler, although it is not impossible, and in some cases even is standardised. (2.) Three-wheelers usually have larger engines than the average mediumweight motor cycle with sidecar, and in consequence a higher insurance premium is generally demanded; the tax is the same as on a sidecar outfit of similar weight. (3.) The depreciation on a modern three-wheeler need be no more than that on a sidecar outfit of similar value. (4.) In many cases repair charges, etc., and garage fees when on tour, are higher for the three-wheeler than for a motor cycle and sidecar, but this is not invariably the case.

DISMANTLING ZENITH-JAP ENGINE.

? My machine is a 1914 $3\frac{1}{2}$ h.p. single Zenith, with J.A.P. engine, and I wish to rebush the main bearings and connecting rod. I have the engine down as far as the inside half of the engine pulley and the timing pinion on the crankshaft. As for the pulley, it refuses to come away, even after holding the crank case up by the pulley and striking the shaft on end with a hammer. (1.) On the inside half of the pulley there is fitted a loose ring on the ball bearings. Is this ring part of the flange, and is there any other fixing besides the square shaft for holding the pulley? (2.) How is the timing pinion fixed?—R.C.

(1.) The inner flange of the Zenith variable pulley is pressed on to the squared part of the main shaft. The loose ring at the bottom of the pulley has nothing to do with the fixing. These flanges are very easily broken if roughly handled when removing, and you should obtain the use of a pulley drawer. (2.) The timing pinion is screwed on to the shaft with a left-hand thread.

An Argson invalid tricycle (which has an engine of only 170 c.c. capacity), taking two up the 1 in 7 gradient of Fitzjohn's Avenue, Hampstead, London, N.W

Price Reductions.

The prices of lubricating oils marketed by Shell-Mex, Ltd., have been reduced; while the compression puncture-proof tubes sold by Bramco, Ltd., of Coventry, are also the subject of a 10% drop.

Plug Popularity.

Some painstaking individual counted all the sparking plugs fitted on the machines exhibited at Olympia, and his figures indicate that quite 62% were of Lodge manufacture, the balance being divided over fifteen other makes.

American Speed Championships.

It is a somewhat remarkable coincidence that, in addition to recently carrying off the 1,000 c.c. Brooklands Championship, the Harley-Davidson should also be successful in winning all the American national championships. The rider in the latter case, over the one to fifty miles distances, was Fred Ludlow, his best average speed being 81.8 m.p.h. (for the mile).

Two Useful Handbooks.

"Hardening and Tempering of Engineers' Tools" (9d., Percival Marshall and Co., Ltd., 66, Farringdon Street, London, E.C.4). The tempering of lathe and other tools used in the motor cyclist's garage is an exceedingly useful accomplishment, and full instructions as to the methods employed are given in a simple and practical manner. "The French Polisher's Handbook" (2s., from the same publishers). Of little application to motor cyclists, this book will appeal, nevertheless, to the handy man.

Lighting-up Tables.

Some time ago H. Taylor and Co., Ltd., 52, Sussex Place, South Kensington, London, S.W., announced the fact that they would send their 1922 lighting-up table to any reader of *The Motor Cycle* who required one, and in consequence their stock has been completely exhausted; it will be replenished shortly, however, so that all applicants will receive the table in due course.

Found on the Road.

On the 20th of last month Mr. J. A. Check, of Linden Lodge, Bolingbroke Grove, S.W.11, found part of a P. and M. gear change control, between Leatherhead and Guildford.

"XF 1455" writes to say that he deposited at the Maidenhead Police Station seven tools wrapped in a rag, which were seen to drop from the toolkit of a motor cyclist who was crossing Maidenhead Bridge at two o'clock on November 19th.

A toolbox, which the owner may have on forwarding full particulars, was found between Kingston and Thames Ditton on December 4th by Mr. H. K. Craig, 83, East Hill, Wandsworth, S.W.18.

Sidecar Outfits for Nothing!

Last week we illustrated a miniature model Norton sidecar outfit, which was much in evidence at the Olympia Show. These models, printed on sheets of cardboard and marked for cutting out and gumming together, are to be obtained from Norton Motors, Ltd., Bracebridge Street, Birmingham, no charge being made, and they are forwarded post free.

To Improve Physique.

It is perhaps not generally known that the famous spring house of Terry and Sons, Ltd., of Redditch, is not confined entirely to the motor and cycle trade. Almost anything in which springs figure is produced, and not the least important line is a range of exercisers for physical culturists. In this connection the firm is running a competition at the present time, and anyone interested should apply for particulars.

Catalogues Received.

B.S.A. Cycles, Ltd., Small Heath, Birmingham: A useful list of spare parts with illustrations and prices, which should be of great value to the owners of 1921 4½ h.p. B.S.A. single-cylinder machines (models H2 and K2). It can be obtained post free on application.

Thompson Bros. (Bilston), Ltd., Bradley Engineering Works, Bilston, Staffs.: A list describing the air and water-cooled models of the T.B. runabout, including a spare parts list and full information concerning the chassis, sub-frame, steering gear, engine unit, and wheels. An excellent lubrication chart of the chassis is appended.

W. Montgomery and Co., Ltd., Leicester Causeway, Coventry: All types of touring sidecars made by this firm are dealt with in the latest catalogue, which also describes the patent pattern Bo-peep windscreen and a tradesman's carrier sidecar.

Wulfruna Engineering Co., Ltd., Brickkiln Street, Wolverhampton: Full details of the 2½ h.p. Blackburne-engined model, the 2½ h.p. fitted with the two-stroke Mark IV. Villiers engine, the 2½ h.p. with the 293 c.c. J.A.P. engine, and the 4½ h.p. Blackburne-engined model.

Brampton Bros., Ltd., Oliver Street Works, Birmingham: A leaflet listing the dimensions (in accordance with the standards of the British Chain Manufacturers' Association) of four new types of motor cycle chains capable of withstanding high speeds and stresses.

Dunhills, Ltd., 359-361, Euston Road, London, N.W.1: Listing all their principal 1922 models, including not only the triangular chassis but a rectangular chassis with two different types of bodies. In addition, a catalogue of Dunhill's sidecar chassis components and fittings, such as mudguards, wheels, springs, connections, lugs, and hubs, is issued.

Trump Motors, Ltd., Foxlake Works, Byfleet, Surrey: A folder describing the three models of Trump-Jap machines, the 2½ h.p. model A with sloping top tube, the 3½-4 h.p. sports model shown stripped for racing, and the 6-8 h.p. all-chain drive speed model.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"R.H.H." (Comrie).—Binks or Degory carburettor on 4 h.p. Coulson-B. Flexibility, speed, consumption, and acceleration.

"A.W.L." (Hornsey, N.).—Any light-weight sidecar fitted to a 3½ h.p. Rudge Multi: Speed, climbing, consumption, etc.

"F.G.W." (London, S.E.18).—Quadrant sidecar outfit: Consumption, speed, reliability, comparisons with other single-cylinder machines.

"A.C.T." (Walsall).—Scott and A.B.C.: Reliability, consumption, power for light sidecar, renewals and replacements in 10,000 miles riding, gears, etc.

"J.T.W." (Eccles).—Bowden air inlet on Triumph carburettor: How fitted, and effect on carburation and m.p.g.

IN CEYLON. One of the most enthusiastic clubs in the East is the Ceylon M.C.C. Recently it held a twelve-hour reliability trial over a strenuous course, which included some fairly severe hill-climbing. The challenge cup offered for the best performance by a team was won by the riders of the Indian machines depicted.

The following remarkable records have recently been made by users of "K.L.G." Plugs :

On November 17th, 1921, at Brooklands, H. Le VACK, riding a 7 h.p. INDIAN Motorcycle, secured new British Records.

Flying Kilo -	-	-	-	-	107.55 m.p.h.
Flying Mile -	-	-	-	-	102.27 m.p.h.

Major F. B. HALFORD broke the following British and World's Records, on a 3½ h.p. O.H.V. TRIUMPH, Class C.—500 c.c.

BRITISH RECORDS.

1 Mile (Flying) -	-	-	-	Speed 87.80 m.p.h.
5 Mile (Flying) -	-	-	-	Speed 81.78 m.p.h.
10 Mile (Flying) -	-	-	-	Speed 80.09 m.p.h.

WORLD'S RECORDS.

1 Mile (Flying) -	-	-	-	Speed 83.91 m.p.h.
50 Mile (Flying) -	-	-	-	Speed 77.27 m.p.h.
1 Hour (Flying) -	-	-	-	Speed 76.74 m.p.h.

Mr. H. H. BOWEN at Brooklands, on November 24th, 1921, riding a 6 h.p. MARTINSYDE, secured the following, 750 c.c. Class—

One Hour Record	-	77.58 miles in one hour.
50 Miles Record	-	{ 38 mins. 33.2 secs.
		{ Speed, 77.81 m.p.h.

Be a good Santa Claus to your motor cycling friend. Give him one of the

TERRY

Floating Saddles

Put him on to the finest piece of comfort and luxury open to the motor cyclist to-day. You know how the springs take the stings out of motor cycle riding.

Order from your Agent to-day. Send us address of your friend—tell us whether to send a light-weight or heavy-weight model, and his body weight—and we will despatch direct to him.

Price 63/- each.

From Your Agent.
HERBERT TERRY & SONS, LTD.
Manufacturers, Redditch, Eng.
Est. 1855.

A set of 5, to keep memory alive.

A Terry high-grade Spanner Set, plated finish, in leather case, would be very timely, and much appreciated. 8/6 per set. Order now from your Agent.

Have oil and petrol squirts close to hand. Clip them to the frame. Save time opening and closing tool bag. Very best quality. 4/- each, from your Agent.

Make your own tool racks, pipe or rubber stamp racks, billiard cue racks, etc. Tool rack clips, 3/- dozen, complete with screws. From your Agent. Name Terry is stamped on each clip.

c22

Reg. No 660,205.

Terry's Wristlet Watch Spring. Neat, novel, secure, and very durable.

Nickel-plated. Gilt or Silvered.
Men's wide 9d. 1/- each
Lady's narrow 6d. 9d. each
From Jewellers, Fancy Goods Dealers &c.

A useful little gift would be a set of Terry's high-grade Tyre Levers in cardboard case. Motor cycle size, 1/3 per set of 3. From your Agent.

THE REVELATIONS OF THE TRIALS

The wonderful successes in the recent A.C.U. SIX DAYS TRIALS of the NEW ROVER and CONNAUGHT Teams again brings to the notice the benefits to be derived from the "BONNIKEN." All these machines were fitted with this type of Speedometer, and the general opinion of the riders emphasises the assistance derived from the use of the Instrument, as the following extract from a letter will show: "All Connaught riders fitted a Bonniksen Speedometer and found them very satisfactory. My personal views on them are that they leave nothing to be desired. They helped me very much in keeping to scheduled times, and I relied wholly and solely on them for the speed test at Brooklands."

Lower Essex Street,
BIRMINGHAM.

OMEGA

Utility. Omegas are primarily designed for utility purposes—to suit the rider who wants a three-hundred and sixty-five days a year worker—requiring little more attention than just filling up with petrol and oil. Though Omegas most admirably fulfil that requirement, there's nothing of the cart horse about them—except in strength. Omegas are speedy, tractable, good to look upon, good to look into, and ever ready. That's the reason of Omega popularity. On present day prices better value is a sheer impossibility.

"A machine for every rider."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words 3/—, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but at the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over 50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 10/-. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to **ILIFFE & SONS Limited**.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the notice as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

1920 A.B.C., fitted F.R.S. head lamp and D.A. cylinder; 70 gns.; exchanges.—Kent's, 417, Lord St., Southampton. [2077]

SOLES & HEELS

USTIKON DIAMOND
PATTERN SOLE.

These soles are specially prepared with an adhesive surface and fixed with Sol-fix. The process of fixing is exactly the same as that of repairing a punctured Motor Cycle Tube. No nails or screws are required, and one of the many advantages of this process is that no damage whatever is done to the Boots or Shoes, which become ABSOLUTELY WATERPROOF.

GENT'S, ALL SIZES - 3/9 PER
LADIES', ALL SIZES - 2/9 PAIR

ASTRA

DYNAMO LIGHTING SETS

for

Cars and Motor Cycles

Complete Motor Cycle Sets
from £11-2-0

We give below extracts from two letters which we have received from one of our many satisfied customers. The set is fitted to a 1920 Triumph.

"I should like to thank you for the efficient way you dealt with my order at that time and supplied exactly what I required, the split pulley being a perfect fit. The set has now been in use over a 1,000 miles and given perfect satisfaction and a good light not only in fine weather, but during some very stormy wet rides lately, although I was not using a waterproof cover over it. In fact, I consider it just as good as some of the sets at over twice the price, the catalogues of which I studied at the same time as yours."

Nov. 1st, 1921.

This customer writes later,

"I may say I have no objection to your use of my letter as a testimonial, if of any use to your firm, or to any motor cyclist wanting an efficient generating and lighting set, and wondering as I did whether he must pay about £20 for it, or can get a reliable one at a reasonable figure."

Nov. 7th, 1921.

The original of the above can be seen at our London Office:

The T.T. Dates.

NEVER have the Tourist Trophy races been the subject of so much controversy as this year. The surprise occasioned by the announcement of the A.C.U. Competitions Committee that the 1922 event would be held in Belgium was followed by a discussion as to the desirability of transferring Britain's only road race to a foreign country. Then came the reversal of this decision by the General Committee, and the astounding news that the R.A.C. had annexed the most suitable dates. Until quite recently nothing had been decided, and when the A.C.U., at its Leicester meeting, finally agreed that the races should again be held in the Isle of Man, there was a general feeling of satisfaction.

But even now serious discussion is taking place, this time as to the suitability of the dates chosen, viz., May 30th and June 1st, on account of the fact that this is the week preceding the Whitsuntide holiday.

The Busiest Week of the Year.

The more these dates are considered, the more one is constrained to doubt the wisdom of holding the races at such a time, and, in accepting them, the A.C.U. appears to have overlooked several important points which should have been considered. Firstly, of all weeks of the year, that preceding the Whitsuntide holiday is the busiest period for motor cycle manufacturers, who can ill spare the mechanics and staff from their works at that time.

Secondly, the annual London-Edinburgh event starts on the day following the Senior race. This second factor is important for several reasons, as, with two such important events clashing, the public interest will be divided. Again, a large number of keen motor cyclists who visit the Island, whether as riders, officials, or spectators, usually participate in the long-distance trial to Edinburgh, and with the T.T. dates as at present arranged, one or the other must be sacrificed by them.

We well appreciate that the selection of a suitable date was not an easy matter, but we understand that the Isle of Man authorities were prepared to postpone the car event to a later date if such action were necessary.

If we accept that the pre-holiday week is unsuitable—and we cannot see how it can possibly be proved satisfactory—the choice seems to lie between:

- (1.) Fixing the dates of the motor cycle races a little earlier.
- (2.) Postponing the races a fortnight by arrangement with the parent body—the R.A.C.
- (3.) Holding the races in September after the Manx Highway Board has had time to repair the roads after the car races.

Of these suggestions, the second seems to offer the greatest satisfaction. Certain it is, an effort should be made immediately to change the date to one in keeping with the importance of the historic Tourist Trophy event.

Winter Riding.

THERE are a few motor cyclists who annually lay up their solo machines during the winter months for fear of skids on the greasy roads. Such a course is certainly not warranted with modern machines, and the owners lose much enjoyment by its adoption. No machine is skidproof, but, given a modern machine with reasonably low centre of gravity, good tyres, and careful riding, there is little to be feared. Many riders make a mistake in travelling too slowly over grease, and in employing too high a gear. When travelling slowly in traffic, the low gear should always be employed if the streets be greasy, and the throttle should be handled gently, clutch engaged smoothly, and the spark lever retarded more than usual.

Our advice to nervous riders is to keep their machines on the road and enjoy the exhilaration which can only be obtained by a run on a bright winter's day.

Dope for Hot Studs.

INSPIRED, no doubt, by a wise paragraph in *The Times*, the technical press of the country, in all its various specialist departments, now devotes quite a lot of attention to inventions, specifying crying needs and trusting inventors to solve the problems. To contribute my modest quota, I would suggest that there is room for a heatproof lubricant for application to screw threads subjected to high temperatures. Four times in one week recently I met engineers wrestling with immovable threads, rust ascribable to exposure to water having complicated the problem in each case. The four instances related to:

- (1.) The release valve of a baby two-stroke.
- (2.) The cylinder head fittings of an air-cooled cycle car.
- (3.) The alleged "detachable" head of a four-cylinder *monobloc* water-cooled American car.
- (4.) The valve caps of a motor lorry.

The last-named gave the most trouble, for it was of foreign make, and no spares were procurable. Soaking with turps and paraffin, heating the engine, and then chilling the valve caps, colossal spanners clumped by local Hercules with huge mallets—all failed; and, at the moment of writing, these valve caps are still in position.

Assembled Machines.

OLYMPIA impressed me with the extent to which the production of "assembled" machines is growing. Of course, every motor cycle is "assembled" in the strict sense, but the term is a handy colloquialism for a mount embodying a proprietary engine, gear box, etc., built up into a frame by some local dealer. When one can buy such excellent engines as the J.A.P., M.A.G., Blackburne, Villiers, and others, such sound gear boxes as the Albion, Sturmey, Burman, Jukes, Jardine, Moss, etc., the "assembling" policy naturally thrives. There are three points in favour of the "assembled" machine, as contrasted with the mount which is an original design throughout. The assembled machine is usually *cheaper* than the average of its class, for a firm which turns out 10,000 engines or gear boxes per annum can generally produce more economically than a factory with an output of 1,000 or less. The assembled machine usually consists of *standardised parts*, easily obtainable anywhere; this is only true of such original machines as enjoy really large outputs. The small assembler can *modify his specification* to suit the fads of an individual purchaser. In fine, the assembler offers buyers a cheaper standardised machine, embodying some of his own notions.

The Obverse.

ON the other hand, the selection of an "assembled" machine demands a certain amount of caution. There are *big* assemblers, who can offer buyers all that the "special design" factories can give. They are just as jealous for their good name as any of the great factories. They offer us the same kind of service. Their guarantee is as good as the best. Their machines command excellent prices second-hand. By contrast, a deal with some of the petty assemblers is a very different pair of shoes. Such a man may not have the will or the power to give his clients any service at all. His guarantee may be almost worthless. His machine may depreciate quite abnormally in twelve months, partly because it is almost unknown, partly because it has no permanent backing behind it. If I were extremely impecunious; and knew a sound mechanic in a back street who assembled two or three good engines into frames every year, I might be wise to give him an order. Being poor, I should buy the machine for keeps, avoiding the loss which comes from an annual sale. I should get a cheap, sound machine from him, and, living close at hand, I could rely on him to treat me fairly. But I should be a fool if I bought his machine with the intention of selling it next autumn, or if I lived any distance away. Under these circumstances, if I wished to avail myself of the special advantages of an "assembled" mount, I should select one of the big assemblers. "Assembling" is, of course, almost a habit with the American car manufacturers, most of whom are assemblers pure and simple. It is odd that this Yankee trade policy is so largely adopted in the British motor cycle industry, and so generally eschewed in the British car industry. It is perfectly sound in itself, and makes for economy; therefore, it is spreading perceptibly in our light car trade, where every shilling counts; and the reasons for its growth in the motor cycle world are similar.

The Scott Squirrel.

LOTS of Scott-enthusiasts proved faithless to their first love because they wanted a little more speed. The average Scott in private hands gives about 45 m.p.h., which is fast enough for many people; and it is faster than it feels or looks, because it takes nearly all hills in its stride on top with little perceptible slowing. But when 234 h.p. sports models begin to appear with guarantees of 70 m.p.h., the Scott had plainly to do something. Hence the Squirrel. Most of its extra speed—it is guaranteed to do 60 m.p.h., anyhow, anywhere—comes from the tiny tips which riders bandy from mouth to mouth, e.g., "an aluminium piston adds 10 m.p.h. to any

Occasional Comments.—

two-stroke, but melts after five miles of full throttle" (except on a very few machines). "Put a plug in the centre of the head, and you'll get an extra 5 m.p.h." (the Squirrel has *two* plugs in the centre of the head, and so presumably gets an extra 10 m.p.h. on that score). But, jokes apart, I notice that the Squirrel is minus the standard sparking plug socket on the rear of the cylinder heads, which must ease the factory job of obtaining a symmetrical cylinder casting free from liability to distort.

Riding after Dark.

FOR many years past I have gone out somewhere on practically every evening in the week. I have seldom used a motor cycle for short distance work at nights. Sometimes I walked. Sometimes I used a push bicycle, because its lamps entailed no real trouble. If the distance was long enough to suggest mechanical transport, I should probably use a car, if one was available, because its electric lighting was so clean and convenient. A motor bicycle would only be employed when the distance was long, and no other mount was available. Comparatively few of my motor cycles have been fitted with electric lighting, because it usually represents a £30 extra, of which a high percentage is a dead loss on a re-sale. For the last few months I have owned one of the cheap little sets (they ought to and will be a lot cheaper, ultimately) which draw their current from the magneto. For some weeks I regarded it with suspicion. It has never let me down, and I see no reason why it should. The result is that I now leap into the saddle after dark without any hesitation. I do not dream of walking, or cycling, or wangling a car. I am already far more mobile and sociable after dark than I have ever been in my life; and I am coming to regard my magneto lights as

absolutely indispensable. I consider that such additions double or treble the value of a utility machine, and obviate the principal criticism which utilitarian users could formerly bring against the motor cycle. The sooner the popular single-cylinder four-stroke is regularly endowed with a similarly cheap and reliable lighting outfit, the better for its future. But, so far, no attempt appears to have been made, to cater in this respect for the owner of a costly $3\frac{1}{2}$ h.p. sports machine, whose requirements are: really powerful illumination (preferably electric), light weight, and/or easy detachability, capacity for fifteen hours continuous use (say, for the London-Exeter trial), and an appearance and finish in keeping with that of a £120-£150 'bus.

A New Tool Wanted?

THE growing popularity of overhead valves suggests that it is time for the accessory makers to market another new tool. Years elapsed before amateurs were provided with tools for compressing the springs of a side valve engine; we used to wrestle with screwdrivers, chip chunks off the cylinder fins, and other chunks off our knuckles. Finally, a lot of tools were brought out, and peace descended upon us. Nowadays the overhead valve is booming, and, to the best of my belief, the only way of freeing the spring *in situ* is to press it down with the fingers; some modern valve springs are far too stiff to lend themselves to finger operation. When the o.h.v.'s are fitted in a detachable head, it is generally possible to put the head in the kind of vice which adorns the bench of the average amateur. — But if designers could watch sundry amateurs of my acquaintance tackling this job, a cold sweat would trickle down their spines. The designing of a tool easily adapted to most o.h.v. motor cycle engines is not a real brain-twister.

A GOOD "BAG."

Although not comparable with a day's game shooting, a day among the rabbits is not to be despised. This year in particular a sidecar has proved a useful vehicle, for rabbits have been unusually plentiful.

TYRE PRECAUTIONS FOR WINTER.

Commonsense Hints on the Care of Tyres.

FOR sheer misery nothing exceeds a winter puncture. It is bad enough on a crisp sunny day, when one had anticipated a rousing ride with a hot meal towards sunfall. But it is a thousand times worse when the tyre goes flat on a wet, dark night in some such thoroughfare as the Lea Bridge Road, with the street swimming in that filthy liquid mire which London brews in December, and motor buses and taxis are flinging splashes all over your cold fingers. Not less mournful is it when the rear wheel begins to bump on some lofty high road about 9 p.m.; two minutes after one has dismounted, face, feet, and fingers are reduced to the consistency of ice, and the possibilities of effecting a sound repair seem infinitely remote.

Yet many stupid riders chance these tortures. They buy a machine in the early spring, wear the covers thin by a hard summer's work, weaken the tubes by a number of patches, some of which were not too well fixed, and then blithely ride on the same tyres in winter, fondly hoping for the best. The coming of winter is the signal for every sane man to overhaul his tyres.

The Safest Plan.

My own practice is to fit a brand new cover to the back wheel every October, reserving any part-worn cover for spring and summer use. The front wheel cover will probably retain its tread corrugations and be free from weak places and bad cuts; I leave it alone. But the all-weather rider's back cover should have a perfect tread, be sound in every stitch of its fabric, and be as thick as money can buy. It ought to be a brand new heavyweight, unless haunting forebodings are to add to the emotional misery of certain runs which winter will surely bring, pleasant as the reminiscences of them may be later on. A doubtful inner tube must unquestionably be changed in October. Just at present there is a certain liveliness in the invention of puncture-proof tubes. I know nothing of the Jeff, which has overlapping leaves of rubber thickly massed on the inside of the tread; theoretically, this construction should certainly seal minor holes. But I have prolonged experience of the Challenger tube, which has a double tread; between these two layers of red sheet rubber is a filling of black plastic stuff, about $\frac{1}{4}$ in. thick. If you stick a nail in an inflated tube a tiny gout of black plastic expands into the hole, and seals it. I am riding on these tubes this winter, and am prepared to bet I shall suffer no road stops with my tyres. Certain puncture-sealing compounds are also being advertised. I have not tried them, though I have tested many of their predecessors. I make a rule to try such com-

The Question of Butt-ended Tubes, with a Word on Inflators.

pounds on the dog, so to speak; in other words, I test them in an old tube, and prove for myself whether they do their work, and whether they prevent a patch from sticking if a patch should ever be required.

Special tubes are rather costly. In default of such wholesale measures as using special tubes in winter, it is comparatively cheap to mount some such nail-catcher as the Monie. Its inventor's theory is that nails normally lie flat on the road, that the front wheel tweaks them momentarily upright, and that, before they can get to bed again, the back wheel runs into them, and down goes your back tyre. I am sure he is right. He has devised a little rubber flap, which hangs down in front of the back wheel, and just clears the road, sweeping down any impudent nails which are poised vertically waiting for the back tyre.

Above all, a spare tube should be carried. The repair of a puncture by the roadside in pouring rain is not too simple a matter at midsummer. In a snowstorm it is almost an impossibility. However cold the hands may be, it is always possible to mount a fresh inner tube, and I carry one as an insurance. Some riders rely on butt-ended tubes. Their extra convenience is so obvious that the continued survival of endless tubes points to intrinsic defects in the best butt-enders. But there is no objection to carrying a butt-ender as an iron ration, so to speak.

Repair Kit and Inflator.

It is also wise to inspect the tyre repair kit. In summer it matters little what we run short of on the road—somebody is sure to come along presently, and lend us what we want. In winter, especially after dark, motor cyclists are rare birds on many roads. The tyre repair kit was probably bought six months ago, and possibly the supply of patches and chalk is low. Conceivably it was bought last year, and it may not have been new stock then. Rubber solution is subject to a chemical process as it ages; I do not think any firm in the trade would recommend its solution when it was eighteen months old.

Nor should the inflator connection be forgotten. Many riders are content with the cheap toy inflators delivered to motor cycle manufacturers in grosses with their tyre contracts. These inflators are often—not always—scarcely more powerful than an ordinary bicycle pump, and their flimsy connections cannot be relied upon after a few months. There are few experiences more agonising than to repair a puncture in bitter weather, commence to reinflate, and have your flexible connection come away at the metal unions.

ROAD RIDER.

CHRISTMAS GREETINGS, 1921.

The Editor and Staff of "The Motor Cycle" Wish all Readers a Happy Christmas and a Prosperous New Year.

PASSENGER MACHINE TOPICS.

Joilings on Matters of Interest to Owners of Sidecars and Cycle Cars, not to mention their Passengers. Collated by "Vedette"

WHY is it that Enfield sidecars are used by motorcyclists with large families more than any other make? Personal observation compels the remark, and additional proof of the statement is supplied by the accompanying photograph, following, as it does,

Six up!—but there appears to be room for one or two more in this Enfield outfit used for advertising schemes in aid of the Isle of Wight's "adopted" French village.

the snapshot of Mr. W. L. Driver's outfit "nine up," which was reproduced in *The Motor Cycle* of Sept. 8th. Both machines are Enfields. The present illustration shows the president of the Newport (I.W.) Football Club (being on dangerous ground, I now quote the photographer's inscription), "accompanied by some of his children," as he tours the district in aid of Monchy-le-Preux, the ruined French village adopted by the Isle of Wight. Does he ever take *all* his children out at once?

THE fittings on the 10 h.p. Blackburne sidecar outfit, illustrated here, would, I think, create a record in accessory equipment. Every conceivable instrument which adds to the convenience and efficiency of a machine has been fitted. The property of a member of the staff of S. Smith and Sons, Ltd., of Great Portland Street, W.1, the machine conveys suggestions as to the accommodation of equipment. Made to the special dimensions directed by the owner, the sidecar has been equipped with a wide dashboard below the wind-screen. Neatly placed on this

are, from left to right, a bezel wind clock, an ammeter and lighting switch combined, and a Smith flush-fitting speedometer. The ammeter and switch combined is a most interesting fitting. A small slide on the dial above the meter shows, when the knurled rim is rotated, the lights which are in operation and also whether the dynamo is charging or not. Two neat hooded lamps serve to illuminate the instruments. Beneath the dashboard and screwed to the off side of the body is a cigarette lighter which receives its current from the lighting installation. The large dim and bright side lamp, provided with two separate bulbs, is fixed to the side of the body, and, as a sidecar lamp, gives an extremely good light. The dimmer bulbs of this and the head lamp, which is of the same pattern, are operated from the circular switch. Other Smith's accessories include an electric horn on the front of the sidecar chassis, and a mechanical and a bulb horn located on the tank and handle-bars respectively. Two neat little fittings, also on the handle-bars, are the licence card holder and rear mirror. More luxurious is the gradient meter fixed beneath the handle-bars on the tank tube, whilst directly behind that is the charging ammeter. A Smith five-jet carburetter has been fitted and is provided with a neat extra air control held at the side of the tank. A butterfly nut registering against a graduated scale at the top of the fitting indicates

the amount of extra air induced. The new Smith dynamo is driven by a Whittle belt from a pulley fixed outside the engine flywheel, whilst the dynamo itself is held by a circular band clipped to the front frame tube. The accumulators are located between the sidecar and the back wheel of the machine as also is the spare petrol tin. The waterproof spare wheel cover at the rear of the sidecar is another of Smith's productions. This year's Show revealed a decided tendency towards the double-seated sidecar with side-by-side accommodation. The Sandum illustrated on the following page was only one of the several bodies of this kind on exhibition.

A 10 h.p. Blackburne tandem-seated sidecar fitted by its owner to demonstrate how accessories should be accommodated.

A Seasonable Digression from Cold Facts and Mechanics.

THE litter of opened letters and torn envelopes which covered the table in front of Chatteris and Bedale was partly accounted for by the fact that they had existed for at least eight weeks entirely on credit; and partly by the spirited advertisement which they had inserted in the agony column of the *Morning Wire* on the previous day, as follows:

TWO Ex-officers, unable to live any longer on their gratuities and decorations, desire employment; stools barred, penpushing abhorred, pittance useless, adventure essential; crime of a sporting nature welcomed.—Apply, Box 353, "Morning Wire" Offices.

This appeal had not brought as big a mail to the flat near Buckingham Gate as its authors expected; but their usual budget of envelopes with the flaps tucked in was certainly augmented by a few bearing orange twopenny stamps; and Gerald Chatteris, V.C., appeared to find one of these latter missives quite interesting.

Vague but Possible.

"This fellow's a bit vague, Arthur," he admitted. "Gives no name, but says that if we mean what we say, we're to ring up Gerrard 899746 immediately. There are three heavy penstrokes under 'immediately.' The rest are mostly from old ladies recommending us to apply to war charities, or from Jews offering to lend us money. Any luck in your batch?"

Arthur Bedale swept a heap of crumpled papers contemptuously off the table.

"Two rich tabbies want footmen, one profiteer seeking game-keepers at a quid a week, and a firm looking for insurance touts. I'll ring up Gerrard 899746 before the company disconnects the line. They're unhooking us to-morrow, you remember, if the bill isn't paid."

Bedale lounged across the flat, picked up the receiver, and talked into it at intervals for five minutes in that tired voice with which the best type of service man camouflages his secret energy.

"He's coming round straight off in a taxi," he reported. "Still refuses his name, has an oily voice, and sounds a bit nervy. Probably it's crime, and his maiden venture at that."

Fifteen minutes later the bell rang, and Chatteris admitted a rotund, opulent-looking youngster of some thirty summers, with a fat pink face; somewhat blotched with pallor. In spite of his evident anxiety, his eyes roamed keenly round the flat, and he did not fail to note the unpaid bills on the table.

"Is it Crime?"

Bedale indicated a chair, and the trio sat down and faced one another. In awkward conversations, the best thing is to let the other man start. All three knew this simple rule. Chatteris and Bedale held out longest. Finally the stranger stammered.

"Well—er—gentlemen, I saw your advertisement . . . " he broke off.

"Is it crime?" interrogated Chatteris helpfully.

The visitor nodded silently.

"Name it—we ain't schoolgirls," contributed Bedale.

The visitor swallowed. At last with an effort . . .

"We want a man kidnapped."

"And then murdered?" enquired Bedale hopefully.

This aroused the stranger. He had been studying his inquirers, and had clearly made up his mind about them.

"Not at all. You mustn't hurt a hair of his head. You will simply collar him, remove him to a safe place for seven days, during which no living soul must learn his whereabouts. Then you release him. The

Out of a Jo3.—

business must on no account be traced back to me; and if there is any racket, you will stand it."

"And the terms?" blandly asked Chatteris.

"You're selling!" snapped the visitor.

"And you're buying!" retorted Chatteris.

The visitor stared Chatteris hard in the eye, and his gaze did not fall when Chatteris returned the gaze with interest. Finally, he leant forward and tapped the table vigorously.

"As your friend said just now, we're not children. You want money. A lot of it, probably. I want something done which is clean outside the law. I'll give you a thousand pounds for your week's work. If you're neat, there isn't an atom of risk in it—until afterwards. You can lay your plans to clear the country on the eighth day, and many a Colonial millionaire has started with less money than the pair of you'll have then."

Chatteris and Bedale looked at each other for a minute. They did not seem quite easy in their minds. Then Bedale remarked in his tired voice, "Our advertisement said sporting crime."

"Sporting?" snapped the visitor. "I am no judge of sport. I will mention the words 'Sinn Fein,' and remark that the Irish negotiations are still in a very delicate position."

* * *

Half an hour later the door shut behind the mysterious stranger. On the table lay ten £100 notes. On the back of a wine merchant's bill in Chatteris's neat script were jotted notes to the effect that John Hunter (personal appearance described in full) was to land at Falmouth *ex* the *s.s. Ruritania* two days later; that he was on no account to get further than the arrival platform at Paddington, except in the custody of his amateur gaolers; that he was to be detained till January 1st in any safe hiding place; that any mishap was to be instantly reported to Gerrard 899746; and that in the event of failure the notes were to be returned intact by registered post to Archibald Jones, Poste Restante, Charing Cross.

Somewhat Too Drastic.

Bedale shut the door, and the two fell into armchairs and stared mutely at each other.

Chatteris broke a long silence.

"What tactics?" he enquired.

Bedale was fairly prompt with a suggestion. "I travel up with him. Pull the communication cord at an agreed spot. Push him out. You are waiting with the sidecar. You offer him a lift. Take him to secret haunt of the gang. Gag. Bonds. Chloro-

form, if necessary. Passages booked for Rhodesia on January 2nd."

"Rotten!" criticised Chatteris. "We can't dump him off a train in daylight, and you can never be sure when those darned liners will get in. We've got to sandbag him at Falmouth or in town. Bigger the place, the less the risk. We'll get him at Paddington somehow."

"I've got it," said Bedale eagerly; "really, crime is as easy as falling off a log when you once start. We both travel up with him in the same carriage. Chum up all we can. Our Rolls meets us at Paddington. Offer him a lift. Thus to the den of the gang."

Rolls-Royce or Matchless?

"Two snags," returned Chatteris laconically. "First, we haven't got a Rolls. Second, this den is going to be in the hands of bailiffs long before January 1st."

Bedale was developing. He tapped the bundle of notes meaningly.

"Hire a Rolls, chauffeur, and all complete. Transfer den of gang to keeper's hut in my uncle's old coverts above Abingdon. Happen to know the new landlord's bluing his war profits at Monte."

Chatteris shook his head decidedly. "We can't touch this cash till we've earned it. The fellow may be a wrong 'un, but he's trusted us with £1,000, anyhow."

Finally the pair compromised. The Matchless sidecar, their only remaining valuable, was worth £140 anywhere. They would dip into Archibald's £1,000 for necessary expenses. If the stunt failed, the outfit would have to go under the hammer. Time was short. Bedale went down on the Matchless to inspect and stock the keeper's hut, whilst Chatteris accumulated certain munitions of war at the flat, and paid deposit on two passages to Rhodesia. On December 23rd the two travelled down *de luxe* to Falmouth, studying the written description of Hunter till they knew it by heart.

* * * * *

Big, broad-shouldered men with flaxen hair are not common. Five seconds after John Hunter swung his grip up on to the rack of a first-class carriage in Falmouth station, two smaller men of military bearing collided in the corridor, wrangled politely for a moment, annexed seats opposite Hunter, and settled down to the perusal of *The Times* after that half-timid, half-suspicious stare at each other with which the travelled Englishman honours his own kith and kin. The plan of operations was for Hunter to be drawn into a gradually tightening intimacy *en route*. Hungry for the conversation of his own kind, he needed

"Quick to greet any pretty girl."

Out of a Job.—

no drawing. Long before Paddington was reached the three were ostensibly great chums, though equally ostensibly they had never met before. Chatteris had successfully arranged that the trio were to share his car to his flat, change into war paint there, dine at the Ritz, and do a revue. A handsome Rolls was duly waiting at Paddington, and fortunately there was neither dun nor bailiff at the flat when Chatteris inserted his latch key. Ten minutes later, whilst Hunter was gratefully accepting a cocktail as a reviver after the unwonted effort of knotting a white tie, Bedale scientifically chloroformed him from behind.

—not always what they seem.

The two conspirators looked uncommonly foolish for successful criminals.

"Hanged if I like the job," muttered Chatteris sheepishly eyeing the unconscious figure on the bed.

"We're not going to hurt the fellow. You go down and get the old Matchless round while I jam this victim into two or three heavy coats."

* * * * *

The Matchless was to provide the transport of the night, partly because it was cheaper than hiring a Rolls, partly because it dispensed with letting a paid driver know anything of the hideous doings which were afoot. By 10 p.m. the Matchless was dodging through the traffic bound for the Bath Road. The camouflage was Bedale's brainwave. All three men were in evening dress, not too closely concealed by heavy coats till London was cleared. Chatteris, driving, was cheerful, but not too merry to drive adroitly. Bedale, on the carrier, was two stages merrier—quick to greet any pretty, genial, or comic personality on the pavement. Hunter, in the sidecar, had clearly dined not wisely but too well; he lay back comatose, and when passing a point policeman at a traffic crawl Bedale cheerily bent over him and spoke encouragingly of the beneficial effects of one more small drink. They were obviously three undergraduates who had been celebrating a footer victory in town. But once Hounslow was cleared coats were buttoned up to the neck, opera hats discarded for T.T. helmets, and the throttle flew wide open. Bedale still kept a watchful eye on the passenger, and there was a little bottle in his hand.

The Matchless ran as a Matchless always does, and it was hardly a young man's bedtime when she clambered up the mass of wet leaves which composed the last lap before the keeper's hut. Hunter was disembarked, dragged upstairs, and a certain restorative was administered. When he showed signs of coming round he was rapidly tied up, and a big scarf round his mouth protected the two amateur criminals from the denunciations which they were uncomfortably conscious they might possibly deserve.

His eyes were not pleasant reading as consciousness slowly returned into them. Bewilderment and

incredulity were their main expression for several minutes after he was able to take in the figures of his companions and the nature of his surroundings. Presently anger became an obvious ingredient in his feelings. Then anger appeared to give place to a cold, contemptuous scorn. Gradually a certain amount of perplexity seemed to be mixed with his contempt. He had eloquent eyes, and Chatteris and Bedale wriggled as they had never wriggled since they left school.

Finally Chatteris thought it was time to clear up the situation. He began rather nervously.

"Look here, Mr. Hunter, we've decided to be perfectly open with you. We bear you no malice. We shall do you no harm. We've been well paid to detain you here for one week. We intend to do it. We are—er—desperate men. At the end of that week you may go wherever you wish. During that week I regret that we must keep you in irons; you are a big man. We prefer a quiet life, and we must, therefore, keep you gagged, unless we have your word that you will make no noise likely to betray your whereabouts. Otherwise, you can have anything you want, and we should like you to be comfortable."

Weakening Fast.

Bedale, who had taken quite a fancy to their massive prisoner, was weakening fast. He broke in,

"As a matter of fact, old chap, we're darned sorry it's you we had to sandbag. Hocussing an entire stranger is one thing—this is another. Anybody can see you're a good sort. Nod your head for the silence parole, and I'll take that scarf off. The only thing I don't like about you is your politics."

The prisoner nodded. Chatteris and Bedale both dived at the knots of the scarf, and Hunter's mouth was free in a moment.

"Who told you about my politics?" he asked quietly. Chatteris and Bedale looked at each other.

"Our employer," replied Chatteris.

"It's odd," murmured Hunter, "because I haven't got any."

The amateur criminals filled their pipes, and, noticing an imploring look in Hunter's eyes; did as much for him. All three smoked silently for ten minutes or more. Finally, the prisoner let his pipe drop out of his mouth. It fell with a rattle on the bare wooden floor. Chatteris and Bedale jumped. Then Hunter asked quietly:

"What are the orders of the day?"

"For you, d'you mean?" asked Chatteris.

"No, for you."

"We earn our money if we keep you here seven days."

"Can I write a letter?"

"Certainly not."

Another long silence followed.

The prisoner broke it at last.

"You fellows have been had. I can see you're

"He had eloquent eyes, and Chatteris and Bedale wriggled as they had never wriggled since they left school."

Out of a Job.—

straight, though appearances don't point that way; so I won't try to bribe you. I am a mining engineer. The mine in which I am interested has been losing money for two years. I've found the lode again. A scoundrel in town has suppressed my reports, and is trying to buy the mine for a song. I came home to stop him. He has paid you to hold me up till the deal's through. Will you go back on him if I can prove my story?"

Chatteris and Bedale conferred in whispers. The mysterious Archibald had merely stipulated that nobody was to know Hunter's whereabouts. Both men were already secretly ashamed of themselves. Finally,

"What do you suggest?" enquired Chatteris.

Rectifying a Mistake.

The prisoner's eyes were half eager, half mocking. "Tie me up as tightly as you can. One of you stay here on guard. The other to go immediately to 1,017, Chancery Lane, and ask for my solicitor, Ted Burns, of Burns, Whetheril, and Stauncey. No—it's Christmas now; you'll find him at Furzedown, Dorking. Your own lawyers will tell you what sort of man he is. If I mayn't write, tell him in any form of words you prefer that John Hunter will call on January 2nd, and that in the meantime he is to refuse to sell, grant options, or otherwise endanger the Oranga mine. Wrap it up as you think best, to exclude any risk of my sending him political code messages.

Another conference between the amateur criminals, when the pair fell to arguing as to who should ride the Matchless up to town: no nice job in the freezing dawn, but they both preferred it to doing sentry go over Hunter. Finally, Chatteris went and Bedale stayed.

Eight hours later Chatteris returned. His face was ruby, whether with the weather or shame Bedale hardly knew. Chatteris strode across the room and slashed the rope off Hunter with his pocket knife.

"I don't know how to apologise, sir," he began. "We've been had. Bedale and I will return our fee to that scoundrel of a City fellow. We won't run if you'd like to jug us. In the meantime you're free. My sidecar is outside, and I'll drive you wherever you want to go. Burns made the whole job quite clear. Here's a note from him."

Hunter rose rather stiffly.

"Hard up, I suppose?" he queried.

"Damnably," assented the amateur criminals.

"You earn your money if I stay here till Jan. 1st?"

The puzzled pair assented.

"Well, I'll stay," volunteered the quondam prisoner;—"I like your crib. I like your grub. I like you. Burns won't let the mine go now, I see. You may as well earn your cash. Is there such a thing as a pack of cards in this wilderness?"

£1,000 to the Good.

Cards were forthcoming. On Jan. 1st the Matchless was once more dragged out of the woodshed. Snow is not good for magnetos, and she started up less readily than her wont. But before long the original three passengers slid down a leaf-sodden ride through the covert.

"By the way," sang Hunter into Chatteris's ear, as the latter opened the throttle, "you never said what you got for this little stunt?"

"Eh?" muttered Chatteris, turning red. "Well, a thousand, if you want to know."

"Put it into my mine," bellowed Hunter as the exhaust evinced a crescendo, "the directors prefer their employees to become shareholders; and they mustn't miss two men of push and go like you."

The average motor cyclist does not in these days vaseline his machine and store it away for the winter, but always keeps it in readiness. Certainly some of the most enjoyable runs of the year may be made on the bright, frosty days of winter. This photograph was obtained near Totteridge.

(Left) The searcher after the historical will find all that he desires at Mont Orgueil Castle, Gorey (Jersey).

(Right) The Cobo district, Guernsey.

The Distinctive Appeals of Jersey and Guernsey to the Holiday-maker.

DIFFERENT motor cyclists have different ideas as to how a holiday should be spent. Some are content to tour—and that strenuously; others prefer to settle at a convenient centre and mingle their explorations awheel with other pleasures quite unconnected with petrol and motors. For the latter class the Channel Islands have a direct appeal. But the motor cyclist who contemplates the Isles for his next season's holiday ground is well advised to choose the particular island that provides the form of environment coinciding with his own conception of "holidaying," for where Jersey caters for, and welcomes with open arms, an army of visitors, the sister isle of Guernsey has charms only for the academic and purely nature-loving enthusiast, who asks for nothing more than "The Great Open."

Guernsey.

Named Sarnia (Green Isle) by the Romans, Guernsey has a quaint old town, St. Peter Port, built in rough picturesque tiers on a hillside facing east, with the smaller islands of the group (Sark, Herm, and Jethou) a

few miles distant. Alderney lies some twenty miles to the northward and Jersey about the same distance south-east.

The island is a veritable network of lanes and roads that carry what is to the uninitiated a bewildering stream of traffic, mostly petrol-driven, a large fleet of motor 'buses, and a tramway. Everywhere on the coast are spots of wild beauty, a sunset on the green heights of the extreme western point (Pleinmont) having in it the silent romance of solitude and a mystery all its own when the shadows steal in from the mighty, unbroken expanse of the Atlantic. Those heights were loved by Victor Hugo, whose home in Hauteville is open to visitors.

A twisting road leading from the sea at Bouley Bay, Jersey.

St. Peter Port, Guernsey, from the south.

Main roads are in excellent condition, and although there are by-ways where a spring frame might be advantageous, the surfaces are generally superior to roads on the mainland. From the island capital, St. Peter Port, boats run daily in the season to Sark, a little isle almost untouched by the mechanical genius of man, and where utter severance from the "busy outside" is always to be had—with all the advantages of modern civilisation within ready

In the Channel Isles with a Motor Cycle.—

reach. Herm and Alderney are also easy of access. St. Peter Port has its cinemas, concert parties, libraries, newspapers, taxis, and cabs, but the island's shores have no bathing machines nor nigger minstrels—on Sarnia the "Great Open" is yours.

Jersey.

A busy hive of visiting pleasure seekers and native activity, Jersey is best described as a "little Brighton."

It has all the fascinations and attractions that its staid sister isle has not. The cliffs have not the magnificent greenery nor heather of Guernsey, but the larger area of the country has in it an appealing aspect of old-world beauty that is equalled only in some portions of Normandy. The roads are not all they might be, but withal the surface can be generally described as good.

Two railway lines run out their network of rails to the two extremes of the isle—Corbière and Gorey. St. Helier's, the capital, is a model little town, having in its long season every one of its huge number of hotels booked up months ahead. Here the visitor at the end of the day is catered for in every conceivable manner; there is, too, an excellent promenade extending out from the town to St. Aubin's. About this wee city o' nights is an atmosphere of laughter and song

that has all the French *flair*, with a sobering touch of British reserve.

Hills—and Golf!

Both isles can provide the inevitable searcher after stunt hills all that he can desire in vile surfaces and nasty hairpins—the Zigzag and Les Niaux in Guernsey, and Mont Misere and Bouley Bay Hill in Jersey—and there are others! L'Ancrese in Guernsey is a really magnificent natural golf course, and Gorey in

the sister isle annually attracts a huge quota of enthusiasts. It is perhaps unnecessary to emphasise the historical churches, ruins, and archaeological remains to be found throughout these Norman islets.

Cigarettes are obtainable at 6d. for 20, the milk and butter is world-famous, and the natives constitute a genial,

placid race. There is ample room for touring; there is much that is old, quaint, and new to be seen. The whole area is British, and everywhere the English tongue is spoken. Motor cycles are permitted to be landed without question, and a cheap form of visitor's licence is issued. Daily services are run throughout the spring and summer by both Great Western and London and South-Western steamers from Weymouth and Southampton. Some conception of the motor traffic can be gauged from the 540 motor cycles in Guernsey alone, with an additional 500 cars!

WITHOUT CHANGE-SPEED GEAR.

THE simplest possible form of motor cycle is the single-gear light-weight, and it is not surprising that it is a type upon which a large number of motor cyclists favour when first joining the fraternity of the road. The sporting rider, also, favours the single-gear mount, and the direct belt-driven "3½" fulfils the requirements of those who prefer a machine which brings out the skill of the driver more than any other.

These facts considered, it is rather surprising that the single-gear machine is gradually disappearing, and in the light-weight class presumably it is only retained in order that its makers may offer a motor cycle at a low price.

We give herewith a list of these single-gear light-weights arranged in order of their price, from which it will be seen that, although the number has dwindled, there are still sufficient from which to make a choice.

A Motor Pogo.

First and Exclusive
Details of a New
Type of Machine.

Engines of
Various Powers.

Outlined by Hyam A Crank.

"Our machine may be ridden with elegance."

THE reader of *The Motor Cycle* is always a well-informed man, and will, therefore, be familiar with the jumping stick known as a "pogo," now being boomed by the daily papers on the same curious lines which made standard bread, the sweet pea, the diabolo, the North Foreland golf links, and the scooter momentarily famous. Have the possibilities of the motor pogo occurred to any stunt merchant except myself and a gallant soldier with whom I have held converse on the subject? At any rate, we are jointly taking up the possibilities with enthusiasm, and hope to organise immediate mass production, to finance which we are prepared to admit partners with a capital of not less than £100,000.

Outside the Law!

The first item in our ticket is financial. Thanks to the Government's crass lack of imagination, the motor taxation laws only apply to wheeled vehicles. Now the pogo has no wheels, but makes contact with the ground *via* a large ferrule of solid rubber. Therefore, our invention is immune from taxation, registration, and the speed limit, and will be extraordinarily economical to run.

Secondly, ask any soldier what he most detested in the last war, and he will certainly reply, "uncut wire." Barbed wire presents no terrors to an infantryman equipped with our motor pogo. Fitted with a suitable engine, the Guards may pogo merrily over entanglements as if they were non-existent; the pogo will possibly render the comparatively costly tank absolutely obsolete. At any rate, we reckon on receiving such colossal orders from the war departments of the Great Powers that we may not be able to supply the public for years.

Method the police may adopt if the hop limit is exceeded.

Thirdly, every motorist is complaining bitterly of the surface of our modern roads. The tourist who uses a pogo is independent of the roads. If he so desires, he may keep on the roads. Pot-holes do not disturb him; he plants the ferrule of his pogo firmly either in a pot-hole or on the hump before or behind it; in either case his travel is as luxurious as if the road were solid rubber. Should he meet or overtake a motor coach, filling the road from hedge to hedge, he neither hoots, nor dismounts, nor takes the ditch. He merely opens his throttle, and leaps clean over the obstruction. On the other hand, he may prefer to tour, on the wrong side of the hedges, hopping cheerily along inside the fields, and leaping the cross fences as he reaches them. When passing houses, he can increase the altitude at the peak of each hop, see what is happening inside private gardens, peer in at upstairs windows, and the like.

The pogo cannot puncture, for its ferrule is of solid rubber. I may add that to ease the shock of landing after a particularly large hop with our 16-20 h.p. super-pogo, we have commissioned Mr. Rapson to design a low pressure pneumatic ferrule.

We are further approaching the Auto Cycle Union with the intention of offering a jewelled cup for a special pogo class in the 1922 T.T. This offer will be subject to the selection of a suitable course. Any course is suitable for pogoing so long as patches of hard ground about 6in. in diameter exist at average

Section of the motor pogo, showing general layout of the power unit, but not the lubrication arrangements.

Front view of the motor pogo. A de luxe model, with footboards and electric lighting, is contemplated.

A Motor Pogo.—

intervals of, say, 10ft. for a $2\frac{1}{2}$ h.p. two-stroke pogo, or, say, 40ft. for a 7-9 h.p. pogo *de luxe*. We have not yet been able to discover a course which presents sufficient difficulty to make a pogo race really interesting; but our competition manager is now *en route* to examine the possibilities of the Giant's Causeway at middle tide.

Lighting Equipment.

- No lamps are legally required on a motor pogo, which is as yet a completely extra-legal machine. However, as the Government is always ready to strangle new industries, we are negotiating with the inventor of a chain-operated pocket lamp to furnish one of these handy little illuminators suited for our purpose.

It is well-known that in this planet the most muscular man can barely jump his own height. In the planet of Mars, where gravity is 70% weaker, a man could jump to a height of 40ft. with ease. What we are offering the public amounts to the amenities of life in Mars without the trouble of making the journey.

The daily papers suggest that with the ordinary foot-operated pogo certain nasty accidents have occurred through the top of the pogo handle striking the chin of the operator. In fact, a well-informed Parisian correspondent states that Carpentier is training with a pogo.

The typical manly Briton prefers his sports and hobbies to include an element of danger, and we can supply such customers with a motor pogo fitted with the ordinary type of vertical handle. The timid pogoist may, however, specify our special safety type with a U handle. Even when this model is provided with a 16-20 h.p. engine, the U handle clears the rider's chin by at least 8in. in the wildest hops-hops, with an altitude of 50ft. if required. Moreover, since the engine replaces physical effort in our pogos, there is no need for the operator to double himself up in the ungainly fashion which all observers of the French hand pogo must have deprecated. Our machine can be ridden with grace and elegance, and is becoming to ladies.

Hill-climbing.

In climbing hills, the hop is shortened according to the gradient. In ascending small hillocks, the expert motor pogoist goes right over the top, which is tantamount to rushing the incline on a car or cycle. If the hill is long and steep, an ingenious item in the mechanism (not shown in the sketch, for patent reasons) enables the pogoist to substitute a brief and dogged leap for the wild, free-flying jump utilised on the level, which represents motor pogging at its zenith.

Steeple Jack going to work on a motor pogo.

**AN ALIEN.**

There is something strangely incongruous in this snapshot taken on a Scottish highway. Probably no animal looks so entirely out of place under the grey skies of Britain as does the camel—the beast of burden, native of the sandy wastes of Northern Africa.

MUCH has been written in the past and much more will doubtless be written in the future on the subject of the most suitable transmission for motor cycles; and the chain and belt controversy has been keenly waged. This is as it should be, for much good may come from intelligent discussion, and in this case there is certainly something to be said on each side, though I am of opinion that this matter will eventually be settled by the victory of neither belt nor chain, but by the introduction of a third method of transmission, to wit the shaft with either worm or bevel. This last is especially suitable to any motor cycle which has its engine set with the crankshaft longitudinally in the frame, as is the case with all present-day four-cylinder machines and a few others, notably the A.B.C. and the F.N. lightweight (the latter already has shaft drive).

The Advantages of Belt Drive.

To return now to the more fashionable styles of transmission, it may be granted at once that the belt has the advantage in simplicity and initial cheapness. It is a much simpler matter to design a machine suitable for a belt drive than one which has to withstand the greater stresses of a chain. Before the introduction of the countershaft gear box this particular point had greater weight than it has at present, for a chain needs a countershaft in any case, whereas a belt can be taken straight from the engine to the rear wheel—in fact, it is better so, for fairly long distance between the driving centres is desirable in

belt drive, or even essential; but in chain drive it is not so, for a long chain, if at all loose, is apt to swing and mount the sprocket when a short one will not.

Another point in favour of the belt is that rubber belts (and most belts are rubber in these days, though some very good leather belts are still on the market) are clean to handle and need no dressing or lubrication.

Some Notes on Design.

Theoretically, when a belt is used for the transmission it should be between the engine and gear box, that is to say, when the whole transmission is by belt the gear box should be in the rear hub and not what is generally called a gear box at all, but a hub gear. Hub gears have, however, very nearly disappeared for a variety of reasons. Therefore,

the statement that began this paragraph comes to this: When a countershaft gear is used the belt should be from the engine to the gear box and the chain from the gear box to the rear wheel, or, in other words, belt-cum-chain is better than chain-cum-belt drive—except in appearance.

The reason for this is that belt speed should be kept high and stress low if the belt is to work efficiently and not slip, whereas chain speed should not exceed certain defined limits, but a chain cannot slip. When a hub gear is employed belt slip can often be stopped by dropping into a lower gear; the belt will then be running at a higher speed and with less tension, for the action of the gears will increase the mechanical advantage. However, the layout of a motor cycle, not lending itself to the best mechanical application

All chain drive—a type of transmission that is almost supreme on big twin sidecars.

Once all popular but now almost confined to lightweights—direct belt drive. This system, however, has more than one advantage besides simplicity—for example, flexibility.

Chain-cum-belt drive—popular, simple, and reliable. The flexibility of the direct belt is lost, but not to a very considerable degree.

Where the belt retains its chief advantage—the Zenith countershaft-in-front drive embodying a variable pulley gear.

Transmission Systems.—

of a primary belt, has prevented the adoption of such a system.

Where a Chain Scores.

The positive drive of a chain is a great advantage, especially in the case of a heavy machine with a sidecar attached and in wet or snowy weather. If proper attention is given to a chain in the garage it will be very seldom necessary to touch it on the road. The efficiency of a good fitting and well lubricated chain is extraordinarily high. To set against these advantages is the fact that greater care is necessary in the matter of alignment and adjustment. The alignment in the first place is a matter for the maker, but the rider should see that he does not upset it by twisting his gear box or rear wheel when chain adjustment becomes necessary or when the wheel is removed for any other reason.

It is desirable that chains should have as much of the slackness removed as possible; but they must not be actually tight or strained, and, as it is very seldom that a chain remains equally tight at all positions of the sprockets, the wheel must be turned round slowly until the position in which the chain is tightest is found (this is called the tight spot), and the chain adjusted for that position. It will be somewhat on the loose side in other positions, but this will have no serious effect, whereas too great tightness will result in broken rollers. Sometimes broken rollers are caused by their being hardened too much in the making, and bad alignment is another cause.

Treatment of Chains.

Probably the greatest disadvantage of chain drive lies in the fact that it is dirty to handle, and unless it is protected in oil and dust-tight cases, it requires periodical attention. In dusty weather an exposed chain should not be oiled, as the road dust and grit mix with the oil and form an abrasive mixture which is very deleterious both to chains and sprockets. It may be lubricated with one of the many chain lubricants on the market (these are a mixture of grease and graphite) applied with a stiff brush after the chain has been rubbed down with paraffin and roughly dried, and this can be done with the chain *in situ*; but a better plan is to remove the chain from the machine occasionally, wash it thoroughly in a dish of paraffin, and afterwards soak it well in the melted lubricant. It is sometimes recommended that the chain be boiled in grease and graphite, but this is a great mistake, for the temperature of boiling grease is about three times as high as that of boiling water, and quite hot enough to draw

Diagrammatic illustration of the bevel and chain type of transmission as employed on the A.B.C.

the temper of the rollers, pins, and bushes, and so to ruin the chain. All that is necessary is that the lubricant be melted, and this takes place at quite a moderate temperature. If the finger can be borne in it no harm will result. This method of treating a chain ensures the lubricant getting well into those parts where it is required, and when there it excludes grit and wet to a very large extent.

Some people maintain that a driving chain does not need a cover. This is true to some extent, because the speed of the chain will throw off the dirt that falls upon it. We must, however, remember that before the dirt is thrown off it will do a certain amount of harm. Although a chain may look moderately clean at the end of a dirty ride, it has been subjected to a certain amount of grinding during the entire trip, and by next morning it will almost certainly be found to be more or less rusty because water has dropped from the rear mudguard upon it during the night.

Therefore, if complete and adequate chain cases cannot be fitted, I am strongly in favour of a light chain cover. I have used the word *adequate* advisedly, because chain covers when complete are worse than useless unless they are properly constructed. I have known cases removed after a winter's riding to be found full, or as nearly full as makes no matter, of mud and water. This is a very poor lubricant for a chain or anything else.

Shaft Drive.

It is my firm conviction that the ideal transmission of the future will consist of a shaft terminating in a bevel (straight or helical) or a worm. With this form of drive it will be better that the engine should be set longitudinally in the frame; the cylinders of a V or flat twin will then be across the frame, but those of a four-cylinder in line with it. It has been asserted by those who know no better that when an engine is mounted in a motor cycle in this manner cornering is rendered difficult or even impossible by the gyroscopic action of the flywheel rotating in a plane which lies across the direction of movement. This is quite a mistake, and has no foundation in fact. The only effect of the flywheel will be to make the front wheel press more or less heavily on the ground according to the direction of the turn, and this is not noticeable in practice.

As the engine will be set in the centre of the frame and the shaft at the side, the drive must pass through pinions at this point, which will therefore correspond to the first sprocket of a chain-driven or the pulley of a belt-driven motor cycle.

Plan of four-speed gear box and shaft drive. The gear box being somewhat to one side, a dynamo might be housed alongside.

Selective clutch type of gear which necessitates an extra chain, but is, withal, very simple.

Transmission Systems.—

This will naturally be the correct place for the gear box, which should differ slightly from that in general use in that the drive should enter on one shaft and make its egress by the other. Every gear will then be equally direct, and only one pair of pinions need be in action at a time, and the efficiency will be high.

Another advantage of the shaft drive is its extreme neatness. The shaft can, if desired, pass through one of the frame members, but even if it does not it is by no means obtrusive in appearance, and it is moreover easy to enclose the working parts in oiltight cases. If this be done the shaft itself can be exposed to the elements without suffering any harm, and no unsightly cases are required. Such a transmission should wear very well, and, beyond periodical oiling, should require no attention or renewals during the ordinary life of a machine.

Two shock absorbers for chain drive using a similar principle—(left) the Sunbeam, (right) the Raleigh.

Shock Absorbers.

It will, of course, be readily understood that when a positive transmission such as a chain or a shaft is used some sort of cushioning device must be employed to soften the harshness of the drive.

There are at present many of these fitments on the market which do their work very satisfactorily. Some

rely upon friction entirely and are, in effect, small clutches, the sprockets being gripped between two plates under influence of a strong spring. In a few cases friction and springs are combined very effectively. Excellent examples of this system are to be found on the Sunbeam, Triumph, and Raleigh motor cycles. Again, it is not unusual to find a slipping clutch on the engine-shaft and a rubber cushioning device on the rear hub. The

Enfield is a good example of this construction. The Enfield gear is, moreover, operated by expanding rings within the sprockets on the countershaft which grip them by friction. This machine, therefore, has its transmission very well cushioned, and it is consequently very smooth in action.

Belt drive stands less in need of cushioning devices, as the belt itself has a certain amount of elasticity, and can slip on the pulley. But even a belt can be somewhat harsh when run over a large pulley on the countershaft behind the engine, and would then be improved by a shock absorber. The Zenith method of placing the countershaft in front of the engine is good, because it admits of a long belt, which need not be so tight as a short one, and, further, its greater length gives its elasticity a better opportunity of coming into play.

J.H.W.

MOTOR CYCLES IN SYDNEY, AUSTRALIA.

Odd Paragraphs of General Interest from our Australian Correspondent.

NOW that warm weather is coming, all clubs are getting ready for the competition season. There is talk about a few track meets, and it is to be hoped they materialise as they all go to help improve the breed.

* * *

I am informed that a motor cycle, the Hercules, is built in Victoria from English components. This machine is fitted with a Coventry Victor flat twin engine, and with the direct drive model sells for £135. A Sturmey-Archer three-speed box costs £15 extra.

There has arrived here at last a Beardmore-Precision. This machine is being offered for sale at £110, which seems fair enough, but a comparison is not available owing to the absence of similar types of machines.

* * *

Below are the prices of various machines: J.A.P. 4 h.p. three-speed £127 10s., J.A.P. 6 h.p. three-speed £168 10s., Ariel 4 h.p. three-speed £135, Ariel 6 h.p. three-speed £155, Rudge Multi 3½ h.p. £132 10s., Douglas 2½ h.p. two-speed (W.D.) £135, Douglas 2½ h.p. three-speed £150, Douglas 4 h.p. three-speed £190, Cedros 2½ h.p. two-speed £75, Humber 4½ h.p. three-speed £195, P.M. 4 h.p. two-speed £165, Excelsior 7 h.p. three-speed £165, A.J.S. 2½ h.p. three-speed £150, Indian Scout 4 h.p. three-speed £170, Indian 7 h.p. three-speed £185, and Triumph 4 h.p. three-speed £165.

B12

A new arrival is the 6-7 h.p. B.S.A., which is priced at £175.

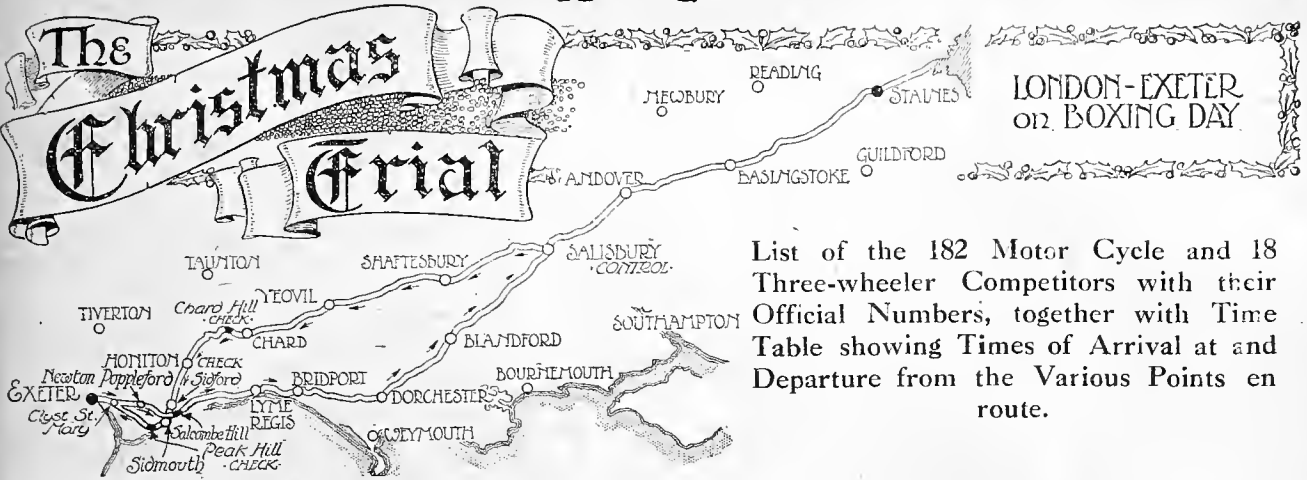

One sees these British motor cycles handled by dealers who hold agencies for American machines. Out of every shop visited in Sydney, only one tried to sell me a British machine, and that was the Douglas agent.

* * *

The results of the Twenty-four Hours Trial held by the Victorian Motor Cycle Club are now to hand. The trial attracted twenty-six entries, including ten Indians, seven Harleys, five J.A.P.-engined machines, two Excelsiors, one B.S.A., and one Douglas. Of the twenty-four starters, eleven came through without loss of points. Of these, six were Indians, four Harleys, and one J.A.P. solo. Of the others, two who completed the course, an Indian lost eight points, and the B.S.A. forty-one points. The distance covered was 400 miles, competitors starting at nine o'clock one night and finishing at nine o'clock the following night.

* * *

The silence of machines is being stressed here at present, and any noisy machines taking part in club competitions will be disqualified. The M.C.C. of N.S.W. propose to import a machine, which I suspect to be Dr. Low's Noisymometer (Audiometer, I think it was called), to determine absolute winners in competitions.

List of the 182 Motor Cycle and 18 Three-wheeler Competitors with their Official Numbers, together with Time Table showing Times of Arrival at and Departure from the Various Points en route.

YORKSHIRE WINTER TRIAL.

Bradford M.C. and L.C.C. Trial for the Spencer Cup Attracts 38 Starters. 35 Finishers.

FIVE LADY MOTOR CYCLISTS IN A WINTER TRIAL.

The Bradford M.C. and L.C.C. has some enthusiastic lady members who are not daunted by prospects of bad roads and weather. The illustration shows—Miss Ida Pickles, Morecambe, (Scott sc.); Mrs. Appleton Bradford (P. and M. sc.); Miss D. Sayles, Barnsley (Scott sc.); Miss P. Barker, Bradford (P. and M. sc.); and Miss N. Suddards, Bradford (Scott sc.).

FINE weather favoured the annual winter reliability trial for the Spencer Cup. The route followed was to Hest Bank, near Lancaster, via Skipton and Settle, the return journey finishing at Long Preston to ensure all the riders completing the course in daylight. The actual distance of the trial was one hundred miles, and included no freak hills or watersplashes. To give all competitors a chance, previous trophy winners had to climb Buckhaw Brow (one mile) at a given speed, whilst members who entered a reliability trial for the first time received a bonus of 15 points. A splendid Christmas lunch was served at the Bradford M.C. and L.C.C.'s expense at the Hest Bank Hotel, and the

arrangements were excellent. Mr. T. G. Bullus (the trials hon. secretary) was responsible for the organisation, and was ably assisted by members as checkers, whilst at the Lancaster end valuable help was given by members of the Westmorland, Lancaster, and Morecambe clubs. Mr. Frank Spencer, the donor of the trophy, was also present.

Hot Coffee en route

The start was at 8 a.m., and hot coffee, served at two places *en route*, was much appreciated. Secret checking zones were arranged, points being deducted in seconds' error against schedule, timing by checkers' watches. Five lady entrants all put up a splendid show, and all

finished inside the allotted time. Mrs. Appleton (Bradford) and Miss Phyllis Barker (Bradford) both rode P. and M. sidecars, whilst three Scott outfits were driven by Miss Nellie Suddards (Bradford), Miss Ida Pickles (Morecambe), and Miss Dorothy Sayles (Barnsley). Abe Waddington, the Yorkshire cricketer, drove a Norton sidecar. Of the forty-two entrants, thirty-eight started, and only three riders retired, tyre troubles being reported in each case.

Results: 1, Spencer Cup (won outright), H. S. Lockwood (3½ Scott sc.), received 15 points bonus, nett error 11; 2, silver medal, W. Moore (3½ Scott), handicap, previous trophy winner, nett error 24.

Motor Cycle Lighting for Indoor Purposes.

How a Discarded Acetylene Generator was Converted into a Reading Lamp.

PARAFFIN oil lamps are very costly to run these days, and many country houses are so arranged that the lamp cannot be conveniently placed for reading purposes. The writer, up against these difficulties, recently devised a very useful reading lamp from a motor cycle Lucas generator and burner, the latter being taken from a discarded sidecar lamp.

The sketch is, I think, self-explanatory. A piece of heavy gauge iron wire was bent into the shape shown, and attached to the usual thumbscrews of the ordinary Lucas generator. The burner is mounted in a twist of the wire loop.

No gas fitter would dream of fitting a pipe installation without water traps at the low points, for condensation is bound to cause fluctuation of the lighting power and general unreliability. The simple water trap shown in the sketch is one which I find essential in the case of the

house lamp, and distinctly beneficial in the case of the motor cycle lamp. It always figures in my acetylene lighting outfits, and I think that if others adopted

Showing how the generator and improvised burner was employed for acetylene lighting indoors

it they would find that many of their lamp troubles would cease. It consists, as will be seen, of a three-point brass junction, to the idle end of which is attached about 2in. of rubber tube, into the bottom of which, by way of ballast, is secured a little set-screw. This hangs straight downwards and traps the water in the gas, the two opposite leads being respectively from the generator and to the light.

My reading lamp costs approximately 2½d. per night to burn; if I use the oil lamp for reading it costs about 9d. Will some electrical "knot" be so good as to advise us how to adapt a Lucas dynamo lighting set to the task of house lighting? I have one standing idle. If one employed a water motor, what size of motor and what head of water would be necessary? Information on this point would doubtless be appreciated by others.

H.M.B.

HIGHWAYMEN'S HAUNTS

The Romance of Wimbledon Common and Putney Heath, and the Houses adjacent to them.

A well-known landmark—the Windmill on Wimbledon Common.

Putney Heath. A miniature lake, Queensmere.

IN these days of high-powered, swift motor traffic, coupled with the fascination of speed, we are all too apt to rush past much that is both beautiful and interesting in the process of transportation from one "resort" to another.

Riders accustomed to speed along the Portsmouth Road over Putney Heath would do well to pause awhile and take a careful survey of some of the unspoilt sylvan scenery hereabouts, for this is no ordinary "common," but a great and historic bit of nature's handiwork, as full of interest and real romance as it is of beauty.

Fine Scenery and Invigorating Breezes.

Bounded on the south by Wimbledon, on the west by Roehampton, on the east by Wandsworth, and on the north by Putney, the spacious and picturesque Putney Heath and Wimbledon Common are justly considered the finest and largest of London's open spaces. Although at no exceptional altitude, these lands command splendid views, and enjoy a matchless, invigorating air, borne on the breezes from the Surrey hills, Richmond Park, and the silvery Thames; and the numerous dignified residences surrounding testify to the esteem in which the place is held.

Most people know the old windmill, the landmark in the centre of Wimbledon Common, and the flagstaff near by; but their geographical knowledge ends there, whereas the things of most interest properly require a day to explore, and well repay the explorer for his trouble.

Putney Heath is, of course, the most picturesque portion of the area, being extraordinarily fertile and rich in trees of all kinds—the silver birch predominating—furze bushes, ferns, wild flowers in abundance, as well as hills, valleys, brooks, lakes, and woods. During the summer many parties may be seen enjoying a picnic in some of these secluded retreats, with nothing to disturb the serenity of the situation but the trickling of a brook or the music of innumerable birds in the trees overhead.

It was not always thus peaceful and safe, however, for here was once the happy hunting ground of the intrepid Dick Turpin and his fellow "knights of the road"; and many an unfortunate wayfarer has been abruptly ordered to "stand and deliver" ere he crossed the heath. The old "Green Man," a favourite resort of Turpin's, still stands at the Putney end of the heath (almost opposite which is the "Pound"); and another, but more picturesque house, once enjoying the merry rascal's patronage is "Ye Olde King's Head," Roehampton, at the western extremity. This is the more ancient of the two houses, with a big tree sheltering its front entrance, to which, no doubt, in its younger and slimmer days, the famous "Black Bess" was frequently tethered, what time her bold master was not at Bagshot, Blackheath, or Hounslow Heath.

Romantic and Historic Associations.

Both Putney Heath and Wimbledon Common, by reason of their convenience, were once high in favour as a *rendezvous* for duels, and among the duellers were Pitt, Canning, and Lord Castlereagh. The Spencer family is associated with Wimbledon. At their old manor house, long since demolished, Queen

Highwaymen's Haunts.—

Elizabeth was entertained by Lord Burleigh. Later this house belonged to Queen Henrietta Maria. Next it came into the possession of Sarah, Duchess of Marlborough, who left it to the Spencers. Its fine park of 1,200 acres was sold in 1836, and the manorial rights finally disposed of in 1871.

Putney Heath has a distinct charm all its own; its fresh wildness and irregularity, rising and falling in pleasant undulations; its mosses, gorse, and wild flowers; the gleam of its silver birches; its keen breeze, all contribute to fascinate the student of nature.

At "Bowling Green House" (on the Portsmouth Road) the great statesman Pitt died; and "Scio House," nearly opposite, was formerly the residence of the late Sir George Newnes. At "West Lodge" lived Douglas Jerrold, and here died Leigh Hunt. "Holly Lodge," in the Wimbledon Park Road, is where George Eliot wrote "The Mill on the Floss"; and Gibbon, the historian, lived in a house on Putney Hill (in Lytton Grove), not far distant. At the foot of Putney Hill, in a large house called "The Pines" (the first house on the left), lived and died the poet

A picturesque inn—the old King's Head, Roehampton village

The "Green Man," Putney Heath, a haunt of Dick Turpin's.

Swinburne, with his friend, Watts-Dunton.

Roehampton House, Lord Leven's seat, through the pretty Roehampton village, is of Queen Anne pattern, dating from 1712. The ceiling of its saloon was painted by Thornhill. During the war this house was used as a military hospital. Near here, too, was Dover House, Lord Clifden's residence, and other famous mansions of bygone glory.

Putney Heath is well supplied with ponds, notably "Queensmere" (down the steep slope from the Golf Club House, near the windmill) and "Kingsmere" (near the "Telegraph Arms"). Caesar's Well, the historic spot marking the Roman Encampment of 2,000 years ago, is worth a visit. It is the best part of a mile from Queensmere, in a southerly direction, distinguished by an encircling camp of fir trees.

Some sixty years ago this ground was the scene of the inauguration of the National Rifle Association's annual meetings, the forerunner of Bisley: Queen Victoria opened the meeting, which was a brilliant and fashionable one, comparable with Epsom Downs on Derby Day.

A. L. SUMMERS.

Competitions at Christmastime.

THE fascination of the winter event is becoming more generally realised by the sporting rider, and this year more than one club has taken the plunge and is boldly organising a Christmas holiday competition. It is a pre-war idea that we feel should be revived. If only judging from the popularity of the M.C.C. London-Exeter Run, such events have a strong appeal at holiday time.

The Birmingham M.C.C. Sporting Half-day Efficiency Trial, to be held on December 27th, may be taken as typical of the style of competition that will be appreciated. Starting at 11 a.m., the competitors are promised that the event will finish within reach of home before lighting-up time.

According to the "prospectus," there will be "plenty of splashes, all rideable (fact!), and if the weather should be good to you some greasy hills." Various more or less novel tests will also be included.

Members of any of the Midland Centre A.C.U. clubs are eligible, entries closing to-day.

Not to be outdone, the Mansfield M.C.C. is holding a hill-climb, open to the East Midland Centre A.C.U., on Boxing Day. There will only be seven classes, and the entry fee of 3s. cannot be considered excessive. Caudwell Hill, near Mansfield, is the venue of the climb.

We shall watch with interest the amount of support these "mid-day" events receive this year, for we believe that too many clubs are inclined to relax their energies around this period of the year.

The success of the two long-distance events—the Exeter run and the N.-W. London M.C.C. open trial to Gloucester—is, of course, assured. The latter trial, by the way, will include one non-stop section in the Tring district, to be taken after dark on the return journey.

Weatherproofing the Speedometer Drive.

Although there is little to describe about the "Speedoguard," there is much to be said in favour of the device, which, as the name indicates, is intended to protect the speedometer gear wheels from mud and water. A grooved channel runs along the top. Price 7s. 6d. (Tippett, Cowney and Groombridge, 6, Alexandra Road, Dorchester, Dorset.)

An Inexhaustible Flash Lamp.

Quite one the neatest of the many self-generating inspection lamps now on the market, is the "Electro Automate" which sells at the moderate figure of 25/-. It is very cleverly designed, and gives a surprisingly good light. (Theo and Co., Hatton Garden, Liverpool.)

Front Wheel Suspension.

Two new front forks, both possessing elements of novelty, are illustrated:

(Left) Called the "Improved" fork, this design absorbs both vertical and diagonal shocks, and has in all three leaf springs, one horizontal and two vertical. The latter connects a casting at the foot of the steering head with two links attached to the rear girders. (L. W. E. Dickson, 1, Molesey Park Villas, St. Mary's Road, East Molesey.)

(Right) An enclosed compression and tension spring and a modified parallel ruler motion are features of the "Swan" fork. (The Swan Engineering Co., Fallings Park, Wolverhampton.)

Spring Saddle Suspension.

Suspended by three-quarter-elliptic springs from the clips on the top and bottom tank tube, the "K" saddle has many features to commend it. The seat may be moved forward or backward, thus adjusting the springs to suit different weights. (A. E. Wilby and Sons, Ltd., Holleway Head, Birmingham.)

Obviating Footboard "Bouncing."

Complaints are often made that footboards do not allow the rider's feet a good "grip" of the machine. The Chako auxiliary rubber footrest overcomes this difficulty. All sizes of footboards may be fitted at 7/6 per set. (Champ, Kay, and Co., Saltisford, Warwick.)

Mechanical Tyre Manipulation.

Five minutes is the maximum time in which, it is claimed, the most obstinate tyre may be removed or refitted, with the aid of the Grado tyre tool. Tube nipping is impossible, and, on the whole, it is among the most ingenious accessories of the year. Price £3 10s. (Grado, Ltd., 26, Cross St., Hatton Garden, London, E.C.1.)

Foiling the Motor Thief.

How the Phillips steering lock acts is shown in the above drawing. When not in use it swings up more or less out of the way. Obviously the heads of the fixing screws must be cut off. (A. Phillips, 199, Darlaston Road, Walsall.)

Greetings!

To all our readers: A Merry Christmas!

The Car T.T.

Entries close for the Tourist Trophy Car Race on Saturday of next week—six months before the event.

Christmas Presents.

Wives and sweethearts of motor cyclists looking round the shops for something suitable for a Christmas present for "him" should remember that the prospective recipient does *not* require an umbrella, and that a leather helmet, a new road clearer, or speedometer, will be more appreciated.

Proposed South African T.T.

South African motor cyclists are confident that they need a motor cycle road race on the lines of the T.T. races, and are now considering a suitable course for this event. It is suggested that the Port Elizabeth district would do admirably, where there is a twenty-mile course over which a hundred-mile reliability trial was recently held.

Two well-known motor cycle manufacturers about to test a new production—F. W. Barnes and George Brough aboard the little Economic, the simplest passenger machine at Olympia.

Informal Meeting of the I.A.E.

Those members of the Institution of Automobile Engineers who, on the 7th inst., attended the first informal meeting held in London since the war had a most interesting and instructive afternoon. Various novel tyres and tyre accessories were demonstrated.

Graduates' Section I.A.E.

Before the Coventry Graduates' Section of the Institution of Automobile Engineers, Mr. C. Ballard read a paper on "Motor Cycles" on Monday, the 12th inst. He dealt briefly with all the outstanding features of motor cycles, and especially with cooling, lubrication, etc. An animated discussion followed, in which many of those present took part. The chair was taken by Mr. J. L. Shorter.

That £2,000,000 Surplus.

When the new scale of taxation was adopted, the Minister of Transport stated that £8,000,000 was required. The first year has already produced over £10,000,000. This surplus of some £2,000,000 should in fairness be remitted, and the late Minister of Transport himself suggested that a reduction would be due if there was a surplus. In bringing these facts before its readers, *The Autocar* urges, in order that a reduction in the onerous

Special Features.

GUIDE TO THE LONDON-EXETER RUN. A MOTOR POGO. "OUT OF A JOB."

scale of taxation may be granted in the near future, that unity of action by all motorists is essential.

For London-Exeter Competitors.

As in previous London-Exeter trials, Mr. James Moffat, Town Hall Garage, Yeovil, will provide coffee for all competitors as they pass through Yeovil.

Unfortunate.

A dislocated shoulder, sustained by H. E. K. Sawtell while playing football recently, may result in his well-known 10 h.p. Morgan being withdrawn from the London-Exeter run on Boxing Day.

Vacancy for a Yarmouth Motor Cycle Club.

A local reader considers that there is a vacancy for an energetic motor cycle club in Yarmouth. There were, he states, some very successful speed trials on the front just after the war.

The Difference.

A writer in *The Autocar* recently described why his friends interested in cheap motoring nevertheless failed to place orders for small vehicles of the cycle car type. Said a typical one: "A peep under-the bonnet settled me. I could never learn what all those pipes and things were for." Now, a good motor cyclist *knows* "what the pipes are for"—wants to know, in fact, and enthusiastically pursues knowledge on the matter. It is just a difference in psychology.

Police Activity in Belgium.

It is not only in England that certain towns suffer from waves of police activity, for just now Verviers, in Belgium, is not a happy place for motor cycling. If, as our informant says, there is a shortage of water in the town, it simply rains summonses, and the very sight of a motor cyclist puts the police into a bad temper. Matters have reached the point where summonses are held in readiness, printed and absolutely complete except for the name of the offender.

Standardisation of Component Parts.

Considerable progress has been made lately by the Committee on Automobile, Motor Cycle Parts of the British Engineering Standards Association—an organisation whose good work is apparent from its name. Seven sub-committees have been appointed, each composed of specialists in the subject under consideration. The Institution of Automobile Engineers may claim much credit for initiating a workable scheme which would not be hampered by the prejudices of various manufacturers interested.

Making Motor Cycling History on

DUNLOP TYRES

THE following remarkable records have been established at Brooklands and provide remarkable testimony to the endurance, speed and security of the Dunlop motor cycle tyres which were used in each instance:

CLASS 250 c.c.

R. W. JUDD (2½ Velocette)

Flying km.	71.70 m.p.h.
„ mile	70.31 „
„ 5 miles	65.61 „

(Latter includes fastest lap ever recorded in this class at Brooklands at 66.11 m.p.h.)

CLASS 500 c.c. Solo.

MAJOR HALFORD (3½ Triumph)

Flying mile	87.80 m.p.h.
„ 5 miles	81.78 „
10 „	80.09 „
50 „	77.27 „
1 hour	76.74 „

CLASS 750 c.c.

BOWEN (Martinsyde)

"The Autocar" Christmas Number.

The two chief items of Christmas fare offered in this week's issue of *The Autocar* are a gruesome story by "Owen John," entitled "Things on Dartmoor," and, in strong contrast, a humorous sketch by Charles G. Harper entitled "Mr. Pickwick's Second Time," narrating the adventures of the genial philosopher and his friends while revisiting their old haunts in a motor car.

Institution Meeting.

A general meeting of the Institution of Production Engineers will be held at 7.30 p.m. on Friday, December 30th, at the Institution of Mechanical Engineers, Storey's Gate, London, S.W. Mr. G. H. Hales, A.F.R.Ae.S., M.I.P.E. (member of Council), works manager of Messrs. Drummond Bros., Ltd., Guildford, will deliver a paper, to be illustrated with lantern slides, dealing with "The Costing System and its Relation to Production."

How the Rolls-Royce is Made.

Readers engaged or interested in automobile manufacture should study a series of articles now appearing in *Engineering Production* dealing with the works and methods of Messrs. Rolls-Royce Ltd. These articles are well illustrated and full of detail, and comprise three instalments, the first of which appeared in the issue for December 15th. It is interesting to record that this is the first occasion during the history of the Rolls-Royce Co. that an engineering publication has been accorded the privilege of describing and dealing with their methods of production. The articles referred to are, therefore, of a unique character, apart from the nature of their contents.

Alsatian Course for the Grand Prix.

The Autocar announces that Strasbourg has been selected as the centre for the car Grand Prix next summer.

Stage Stunts.

If one were travelling at night and met a motor cyclist with an obviously glowing cylinder, one would be led to suspect overheating. That this is not necessary the case was proved at the Levis Athletic Club's smoking concert during a sketch entitled "A Reliability Trial." In this case the effect was produced by a ruby tail light attached to the carburettor illuminating well-chalked cylinder ribs.

Head Light Dimming.

In spite of official notices, there are quite a number of car owners who courteously dim their head lights on the approach of other vehicles, leaving moderately powerful twelve volt side lamps in action. This raises a curious point, for most motor cycles and runabouts have only six volt sets; yet if the smaller craft does not reply by dimming his already feeble light, up go the car lights again, making confusion worse confounded.

A Radial Engine for Cycle Cars.

Suitable for mediumweight cycle cars, a three-cylinder engine of about 850 c.c. will shortly be placed on the market by a British firm. Full details will be published in *The Motor Cycle* in an early issue.

Many sidecars have been brought into service this week for the conveyance of holly, Christmas decorations, and good fare, but few would care to take the risk of carrying such a formidable Christmas tree through town traffic as the rider seen in the illustration.

The T.T. Dates.

In testing the opinions of manufacturers, riders, and others directly concerned regarding the unsuitability of the dates chosen for the Tourist Trophy Races, we find that so far, without exception, these agree with our view as expressed in the leading article this week.

Change of Mounts.

Rene Dequin, the well-known racing motor cyclist, will ride a 3 h.p. Ivy at Brooklands during 1922.

Cars in the London-Exeter.

In addition to the 200 motor cycle and three-wheeler entrants in the London-Exeter, there are ninety-seven cars, a list of which is given in this week's *Autocar*.

London-Gloucester on Hogmanay.

There is still time to enter for the open winter trial of the N.W. London M.C.C. from London to Gloucester and back, to be held on December 31st. Entries close definitely on Christmas Day. Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, London, N 3, is the secretary. Approximately sixty names had been received at the time of going to press. Details of the route will appear next week.

A Triumph Light Car.

For two or three years there have been rumours of a Triumph light car to be produced under the same conditions and to the same standards which have placed the Triumph motor cycle in its present high position. Such a proposition is to materialise at last, for we are able to announce that the Triumph Co. has purchased the works and goodwill of a well-known light car concern, to wit, the Dawson Co., of Stoke, Coventry.

"THE MOTOR CYCLE" FILM.

APPRECIATIONS of *The Motor Cycle* film continue to reach us from all quarters, and crowded houses are the rule, whether it be shown at a club social evening or included in the usual programme of a cinema house.

Mr. R. H. Leech, press secretary of the Stafford and District M.C.C., writes: "Many members and friends were present (at the film exhibition), and the film was proclaimed a magnificent production. A good collection was made in aid of local charity, the Mayor (Alderman T. A. Dunn) being present."

"It was an extremely crowded hall, and all expressed their pleasure with the film."—Mr. A. V. Poyser, superintendent, Princess Mary's Convalescent Centre, Rednal, Birmingham.

On Tuesday and Wednesday of last week it was shown at the "Futurist," Birmingham, on behalf of the West Birmingham M.C.C.—an amateur club, whose lady secretary, Mrs. H. G. Gale, writes: "It is an excellent film in every respect. Like all good things, it passed too quickly."

Since then it has been shown for three days by the Glasgow Western M.C.C., and three days by the Worcester and District M.C.C.

To-morrow and Saturday the film will be shown at York, under the direction of the York and District M.C. Immediately after the Christmas holidays, it goes down to Somerset and Cornwall. On Wednesday, the 28th inst., it will be included in the programme of the Central Hall Electric Palace, Yeovil, by arrangement with the local motor cycle club; on the following day the Truro and District M.C. and L.C.C. is organising an exhibition in Truro; and on Friday it will be shown at the Polytechnic Hall, Falmouth, on behalf of the Falmouth M.C.

The Truro exhibition on Thursday is being arranged in conjunction with the club's annual dinner, to be held in the Women's Institute, Truro.

Applications and enquiries for the film continue to pour in, but we would emphasise that it is now absolutely booked up until the end of April, and that there are not many vacant dates in May.

AN EPICYCLIC COUNTERSHAFT GEAR.

Two Speeds and Clutch Controlled by One Handle-bar Lever in the Lewis Lightweight Gear.

ONE of the charms of the epicyclic type of gear is the facility which it offers for the inclusion of a free engine clutch as an essential part of the gear selecting mechanism. Other minor advantages obtained by the type are compactness, lightness, and silence of operation.

At one time epicyclic gears were in common use on motor cycles, both on the engine-shaft and in the back hub posi-

Small proportions and lightness are features of the Lewis gear, which is here shown, with its bottom bracket shell for bolting to the motor cycle frame.

tions, but the countershaft gear box of conventional car pattern ultimately ended the vogue of the other types. Nevertheless, the charm of the epicyclic type—a charm especially known to experimental designers—results in occasional essays in its direction, and a most practical-looking form of countershaft gear, embodying the ring, planets, and sun train of pinions, has reached marketable form from the workshops of A. F. Lewis, of Oakleigh, Charlestown, Weymouth.

Briefly, the Lewis gear consists of a countershaft spindle mounted in a shell arranged to be secured to the bottom bracket of the machine. On this spindle is mounted a ball bearing chain wheel carrying the internally-toothed driving ring of the gear and another bearing on which runs the belt pulley, to which also are attached five studs, acting as carriers for the planet pinions. Between these two main members slides a sun pinion in constant engagement with the planets. The longitudinal movement of the sun pinion is controlled by a handle-bar-operated push-rod.

Light Weight and Simplicity.

High gear is obtained by releasing the handle-bar lever, when springs in the gear push the sun partially to the left, and cause its teeth to engage with dogs cut in the primary chain ring carrier, thus locking the gears as a solid mass, and giving a direct drive. Free engine position is obtained by pulling up the handle-bar lever until the sun disengages the dogs, and then rotates idly backwards. Further pressure on the operating lever forces the sun to the right, and projecting spigots, formed as a part of it, engage with plungers carried in the low gear clutch member. These plungers expand into an annular recess machined in the stationary portion of the pulley bearing, and there grip frictionally, thus stopping the sun pinion, and setting the complete epicyclic train in motion.

Examination of the accompanying drawing will show that the gear is extremely simple in construction, and that it runs on ball bearings throughout, the bearings of the belt pulley being adjustable. The

only apparent disadvantage—a small one—is the fact that the clutch action is confined to the low gear only; in consequence, it will be impossible to slip the clutch on high gear. Old-time riders of machines equipped with Vindec hubs will recollect that no particular difficulty arose from such an arrangement.

Section of the Lewis two-speed epicyclic gear, showing the sliding sun pinion, its actuation, and the low gear clutch

The Lewis gear is very light in weight (less than half that of the average two-speed and clutch gear box), and the price is moderate. It should be particularly well suited for the conversion of existing single-gear machines.

NEW SCOTTISH LIGHTWEIGHT.

350 c.c. Barr and Stroud Sleeve Valve Engine Embodied in the Three-speed Royal Scot Motor Cycle.

IT is not surprising that one of the earliest firms to fit the Barr and Stroud sleeve valve engine should be a Scottish concern. Actually the Royal Scot motor cycle, made by Donaldson and Kelso, Anniesland, Glasgow, is the second machine marketed with this much discussed power unit, which was first described in *The Motor Cycle* last July, and which was among the most interesting exhibits at the recent motor cycle show.

It will be recalled that a single rotating and reciprocating sleeve is actuated by a horizontal stub extension which is held in a self-aligning bronze bearing eccentrically set in a timing pinion. Suitable ports are cut in the sleeve and in a symmetrical cylinder head. Tests have proved that the engine is of very considerable efficiency for its capacity—350 c.c.

On Conventional Lines.

The remainder of the Royal Scot follows familiar lines, although the spring forks (of the Montgomery type) are not yet common on $2\frac{3}{4}$ h.p. lightweights. A saddle tank of simple outline rests on a sloping top tube, and the lubricating

system at present is by plain hand pump. Transmission is by chain throughout via a Burman lightweight three-speed gear box, and the brakes are internal expanding on both wheels. The price is £85 solo.

It is intended also to market a lightweight sidecar outfit at a proportionate

price; and, in fact, tests have already been made with a sidecar attached. The machine has been found well up to the work of ascending the well-known test hills around Glasgow with a heavy passenger in the sidecar.

Montgomery forks and a B. and S. sleeve valve engine lend distinction to the Royal Scot lightweight.

A NEW LIGHTWEIGHT.

Full Equipment and Clean Lines are Features of the Wigan-Barlow.

THOUGH presenting no great novelty in construction, the $2\frac{1}{2}$ h.p. Wigan-Barlow is well worth careful study, since it incorporates several items unusual in so light and moderately priced a machine.

Standard Components.

A 293 c.c. J.A.P. engine is the power unit employed, and transmission is by protected chain to a two-speed Albion gear box with clutch and kick starter. Final drive is by belt. Front springing is effected by a Maplestone fork, and Webb internal expanding brakes are fitted front and rear.

In addition to the usual aluminium footboards, carrier, etc., the front guard is valanced behind the fork, and $26 \times 2\frac{1}{2}$ in. tyres are fitted, which will add very considerably to the rider's comfort, and will minimise tyre troubles.

The latest type of Best and Lloyd sight-feed lubricator is standardised, and with its dropped top tube and neat finish the machine presents an attractive appearance. An M-L Maghita ignition and

lighting set will be fitted as standard. The manufacturers are Wigan-Barlow

Motors, Ltd., of Lowther Street, Stoke, Coventry, are also contemplating the construction of a somewhat similar machine fitted with the 350 c.c. Barr and Stroud engine.

A neat looking lightweight, the Wigan-Barlow, embodying an M-L Maghita ignition and lighting set as standard. The engine is a 293 c.c. J.A.P.

VULCANISING MADE EASY.

A NUMBER of motor cyclists imagine that the process of vulcanisation is a mystery quite beyond the ken of normal persons, and for this reason a badly gashed cover or tube is sometimes scrapped when it would still have a useful life if properly treated.

Such persons would do well to examine the H.F. Baby vulcaniser. The name of the manufacturers, Harvey Frost and Co., Ltd., of Great Portland Street, London, W.1, has been well known in their particular line since the earliest days of pneumatic-tyred road transport; and from a long experience they have been enabled to combine with their latest vulcaniser all those little conveniences which go so far to assist the amateur.

The vulcaniser, complete with all tools and necessary material, is put up in a compressed fibre satchel some 8 in. square \times $3\frac{1}{2}$ in. deep, so that it

Complete H.F. "Baby" vulcaniser, with its equipment and carrying case.

may easily be carried in a sidecar if a tour is contemplated; and an instruction book is provided, so clearly written that it would be hard to go wrong,

even with no previous experience.

Not long ago we experienced a burst in the rear tyre of a sidecar outfit, and, on returning home, took the opportunity of testing an H.F. Baby. Following the simple instructions with care, an admirable repair was made; and, though the burst had taken place in the middle of the tread, the tyre has stood some two hundred miles road work since vulcanisation, with no signs of wear; in fact, the damaged part is now barely distinguishable from the rest of the tread.

The vulcaniser is provided with a simple adjustable fastening, which enables it to be used without removing the tyre from the rim, provided, of course, that the inner part

of the cover does not require treatment. It should be added that the heat is steam-applied, a simple methylated spirit burner being fitted.

AUTOMATIC CHAIN LUBRICATION.

A DEVICE which, by merit of its simplicity and obviousness, prompts wonder as to why it has never been done before forms the subject of this paragraph. Its object is the constant and automatic lubrication of exposed or semi-exposed driving chains, and the originator is Mr. C. R. Little, of the Constitutional Club, Coventry.

Briefly, the idea consists of a hole drilled radially through the sprocket in the hollow between two teeth. This hole is normally sealed by a small peg, spring loaded, and carrying a small leather

washer under a collar, which acts as a valve. The sprocket itself is constructed to act as an oil reservoir, being closed

An original and simple device for oiling the final transmission chain.

with discs spun into place—one on each side. Almost any make may be adapted.

Obviously, for the half of every revolution the plunger is depressed by a roller of the chain which holds it down, thus allowing a small quantity of oil to escape on to the chain.

For machines having exposed rear chains, the device appears to be an excellent one, and a machine on which it has been running, with only one filling of oil, still retains its final driving chain in well-lubricated condition after well over one thousand miles.

AN INTERESTING SPRING FRAME.

Combined Leaf and Coil Suspension Applicable to existing Machines.

HAILING from Belgium, the Victory spring frame has many points of interest, and embodies advantages which are not immediately obvious to the casual observer. The manufacturers, Victory Constructions Mécaniques, S.A., 540, Chaussée de Waterloo, Ixelles-Bruxelles, who have arrived at the design after considerable experimental work, make notable claims for the device.

It will be seen that the rear wheel is carried in a short link pivoted from the rigid chain stays. The fork-ends of these links have wide faces, and are rigidly dogged to special axle members, so that no twist can take place, and the links on each side must rise and fall together. Enormous areas are provided for the bronze pivot bearings, and a web in the bearing is gripped between the faces of the two bronze bearings so as to provide a friction damping device and sideways location. Should side wear develop after long use, the location can be corrected by facing off a steel distance piece. Attached to either link is a short laminated spring having a loosely mounted extension bolt at the front end. This bolt passes through the chain stay, and is attached to a compression spring above the stay, a rubber stop being provided between the stay and the leaf spring.

Two rather unique claims are made by the inventors: (1) that the machine is actually steadier in grease than a rigid frame machine, and (2) that the upward motion of the rear wheel on striking a bump is balanced by the downward thrust of the leaf spring at the inner end

So neat is the Victory spring suspension that a second glance is necessary to realise that this Belgian-built Rush lightweight has not a rigid frame. Leaf and coil springs, a friction device, and a rubber buffer contribute to the design.

Two bronze bushes act as bearings and as a friction damping device for each link.

Great lateral rigidity is obtained on the Victory rear suspension set; the links are dogged to the axle, preventing an unequal rise, and the main bearings are of ample area.

of the chain stay; and thus a minimum of shock is received by the frame and rider.

No spring frame will give a badly-damaged road the smoothness of a billiard table, despite the claims of many enthusiastic inventors. At the same time we may fairly say that the Victory frame was at least as comfortable as any system of motor cycle suspension that we have yet tested, and the majority of them much more complicated designs.

During a short run over some very mixed roads, the frame, as fitted to a Rush lightweight, proved entirely satisfactory from every point of view. Pot-holes, taken at speed, are, of course, felt, but fail to produce any jar, and, what is even more important, zigzagging on greasy tramlines did not result in a skid. The machine held the road wonderfully, which is particularly noteworthy, since the riding position was thoroughly awkward, and unsuited to the writer.

It is the intention of the manufacturers to market the attachment in this country both as a conversion set for existing machines, and as a proprietary fitting for inclusion in standard models. We are informed that many Belgian machines are now fitted with the Victory spring frame, and many conversions have been made, which all have given great satisfaction.

AN INNOVATION IN COMBINED LIGHTING AND IGNITION.

A HIGH-TENSION magneto which generates direct current for lighting, and has but one armature, is an innovation in combined lighting and ignition sets, which will shortly be introduced by the Combination Metallic Packing Co., Ltd., of Gateshead-on-Tyne. Full details are not yet available to the public. The ignition current is of high tension; it is claimed that full ignition is obtained from 50 r.p.m. of the armature. There is no high-tension slip ring or induction coil, and the make and break automatically advances and retards with the engine speed. Voltage is also automatically regulated, and the direct current

for lighting is of $4\frac{1}{2}$ volts 4 amps., at 500 r.p.m. of the armature under full load. The direct current and ignition

windings are electrically free from each other, and generate independently from the single armature. Its weight is 15 lb.

The "Combination" magneto, which generates a direct current for both ignition and lighting from one armature.

International Conference of Motor Cyclists.

Meeting of the F.I.C.M. at Milan. New Sidecar Classes. Scooters and Motor-assisted Bicycles Defined. Wonderful 100 m.p.h. Records.

THERE was an international conference of the F.I.C.M. at Milan at the beginning of last week. The following countries were represented: Italy, England, France, America, Belgium, Holland, Switzerland, and Spain. Sixteen delegates in all were present under the chairmanship of Count Bonacossa.

A sub-committee was formed to investigate the organisation and classifying of records, and the international records broken during the last year were submitted for sanction. All the British claims were passed, and were, incidentally, 92% of the total.

101.32 m.p.h. for Fifty Miles.

Records in America showed the figures of 104.34 m.p.h. for ten miles and 101.32 m.p.h. for fifty miles. These were made by Otto Walker (Harley-Davidson) at Fresno, California. Other fine times were R. Hepburn's (Harley-Davidson) 100 miles at 88.4 m.p.h., 200 miles at 87.02 m.p.h., and 300 miles at 85.7 m.p.h. French records included Lombard's 75.85 m.p.h. on the Salmson.

Scooters, lightweight sidecars, and two-seated sidecars have all gained international recognition, the following additional classes being instituted:

Class Z.—For motor-assisted bicycles not exceeding 125 c.c.

Class Y.—For motor scooters not exceeding 175 c.c.

Class B-S.—For sidecar machines not exceeding 380 c.c.

Class J-1.—For single-seater sidecars not exceeding 750 c.c.

Class J-2.—For two-seater sidecars not exceeding 780 c.c.

The following definitions were approved:

A scooter is a motor-propelled vehicle carrying a platform, no part of which is less than 30 cms. from the ground, and has a minimum length of 20 cms.

A motor-assisted bicycle is a vehicle having two or three wheels, provided that, if with three wheels, the third is used for propulsion only, whether it is operated by the driver and/or a motor.

It is proposed to form a representative governing body of motor cyclists in Spain. The Spanish Government paid the expenses of the Spanish delegates, so great is its interest in the movement.

The following officers were elected:

President: Sir Arthur Stanley; vice-presidents, M. Longuemare (France), M. Jules Neher (Switzerland); and Count Albert Bonacossa (Italy); hon. treasurer, S. F. Sharp; general secretary, T. W. Loughborough.

A balance-sheet will be presented early next year.

Improved Touring Facilities.

Suggestions for improved facilities are to be presented by each member next year in order to improve international touring. It is proposed to issue a bulletin annually. A guaranteed circulation, however, will be required. This will be discussed later.

It is proposed to make it compulsory for competitors to insure themselves, as a result of some recent fatal accidents. It

was also agreed that at least three competitors from one country entering an international competition shall be permitted to enter at pre-war rates of exchange.

It is possible that the date of the 500 Mile Race at Brooklands will be altered by one week before or after, since it clashes with the Belgian Grand Prix.

Next Year's International Event.

The route of the International Six Days Trials was submitted by M. Neher, and will provide an excellent course. The new rules for this event include the following: That the trophy shall be insured by the winning member for £800; that the trophy shall remain the property of the F.I.C.M.; the winning member shall retain the trophy for nine months, when a model of the award shall be given permanently to the member; the winner shall be permitted to organise and submit suggestions for the following trial.

These proceedings lasted until lunch time on Wednesday, when the delegates were entertained to lunch by Count Bonacossa at his chateau. A visit to the Touring Club of Italy followed, when the members were met by the President, and an excellent set of touring maps was presented to each delegate. A visit to the works of Messrs. Pirelli, the tyre manufacturers of Milan, was made on the Thursday.

The Federation will meet on August 11th, 1922, at Geneva, and also immediately after the Motor Cycle Show, 1922, in London.

HAND-CONTROLLED CLUTCH FOR 1913 INDIAN.

WHEN I decided to fit a hand control clutch lever to my 1913 Indian, the difficulty experienced was in finding a suitable position for the pivot upon which the clutch lever should work. After due consideration I decided to utilise the bolts and nuts securing the gear box to the frame in order to support a pivot. The right-hand plate on the top of the gear box housing was removed, and a piece of angle iron was drilled and fitted into its place with one side on the casing of the gear box. At the rear wheel end of this angle iron a piece of steel rod, to act as the fulcrum, was riveted. This short piece of rod was turned up with a shoulder about 3 in. from the angle iron to ensure the clutch operation being wholly in a vertical plane.

Foot-control Retained.

The clutch lever itself was about 16 in. in length, and at the fulcrum an arm about 4 in. in length was riveted at about an angle of 60°. A short link, shaped like the arc of a circle, was made to join the end of the arm riveted to the clutch lever to the short arm, operating directly the spiral thread. To steady the clutch lever and to act as a guide a further fitment (a guide on the oil tank) was necessary. The operation of the foot-control was in no way interfered with, and the

whole fitment has been working beautifully and sweetly for some eighteen months now. For solo riding the advantage of hand control is very great.—H.W.T.

Hand control for a 1913 Indian clutch. This method of finding a suitable pivot may be adopted in many other cases.

A LIGHTING CASE—AND A MORAL.

A CASE illustrating the folly of withdrawing the war time order which required horse-drawn vehicles to show a red rear light at night came before the Falkirk Sheriff Court last month. A motorist was charged with dangerous driving, and the evidence showed that he ran into the rear of a horse-drawn lorry, which had no rear light, and which he failed to see in the darkness owing to the brilliant head light of a passing tramcar reflecting on the screen of his car and so completely dazzling him.

Misleading to Road Users.

The charge in this case was found not proven, and Sheriff Robinson in giving his decision said people who made orders ought to stick to them. To issue an order that vehicles must have rear lights, and then put it off again, was most misleading to those who were using the roads. In so far as respondent's vision was dazzled by the head light of the tramcar, he was inclined to believe that this was true; but in circumstances of that kind it was the duty of the motorist to slow down or stop altogether until he could see properly, and not, by proceeding, run the risk of knocking into anything which might be standing in the road in front of him.

Junior Car Club.

The president of the club, the Hon. Sir Arthur Stanley, has kindly consented to take the chair at the annual dinner, to be held on January 10th.

West Birmingham M.C.C.

A most successful annual dinner was held at headquarters, the King's Head Hotel, Edgbaston, on Thursday, the 8th inst. This was followed by the presentation of prizes by Mr. James St. John, vice-president. An excellent musical programme ensued, which put the finishing touch to a very enjoyable evening.

Public Schools M.C.C.

With Col. F. Lindsay Lloyd, C.M.G., in the chair, the annual dinner will be held at the Public Schools Club, 61, Curzon Street, Mayfair, W., on Thursday, January 5th, 1922, at 7 for 7.30 p.m. In order that the necessary arrangements may be made, it is imperative that members should inform the hon. secretary not later than first post on Saturday next whether they intend to be present.

Ealing and District M.C.C.

A pleasant evening was enjoyed by members and friends on Monday of last week at the Town Hall, Ealing, where was celebrated the third anniversary of the club. The President, Dr. A. M. Low, A.C.G.I., D.Sc., at the close of the dinner, proposed the toast of "The King," which was followed by a most entertaining speech by Mr. J. A. Masters, the captain, proposing "The Club." Major Empson, proposing the toast of "The President," and Capt. A. Fraser Nash, of G.N. fame, on behalf of "The Visitors," were the other speakers. The President, in reply, quoted, as some of the achievements of the club, the London-Holyhead trial, which was an unqualified success, and the Brooklands race meeting.

Bristol M.C.C.

There was a large attendance at the annual dinner of the Bristol Motor Cycle Club, held recently at the Full Moon Hotel, North Street, the president, Mr. W. B. Carter, occupying the chair. The Chairman presented the prizes won during the past year, quite a creditable proportion of them going to an amateur rider, F. G. Mann (7-9 Harley-Davidson sc.).

Mr. E. Featherstone, treasurer of the Western Centre, A.C.U., in proposing the toast of "The Bristol Motor Cycle Club," said it was a sporting club of which one could be proud. In pre-war times Bristol was known from one end of the country to the other, and had leaders whose names were household words, viz., Rankin, Eli Clark, and E. Kickham, and the last-named they were glad to see back after his accident in the Grand Prix.

Sheffield University M.C.C.

The first annual dinner was held on Friday, December 16th, and was most successful. It was preceded by a lantern display, which included slides from the photographs taken by *The Motor Cycle* photographer on the recent trial at Litton Slack and Cowdale.

Coventry and Warwickshire M.C.

Lieut.-Col. J. A. Cole, the president, occupied the chair on the occasion of the club's annual dinner, which was held, on Tuesday of last week at the Masonic Hall, Coventry. Amusing speeches and more or less impromptu verse-making were the features of the evening, during which an imposing array of trophies and awards was presented to the successful competitors in the past year's competitions.

The Mayor of Coventry promised continued attention to the question of road surfaces; and Mr. J. K. Starley, one of the speakers, reminded his hearers that good roads were expected in view of the taxes contributed by motorists in general.

Mr. V. A. Holroyd extended a hearty invitation on behalf of the committee to Col. Cole to act as president for another year, an invitation which was accepted in a speech in which Col. Cole recalled his very earliest motoring experiences when he visited Coventry to drive away a 6 h.p. Daimler with tube ignition.

The chief prize winners were S. Wright and H. W. Hassall. The latter was especially congratulated upon his success in the Belgian Grand Prix.

Bradford M.C. and L.C.C.

On December 16th the Bradford M.C. and L.C.C. held its second post-war annual dinner at the County Restaurant, Bradford, under the chairmanship of the president, Mr. J. E. Fearnley. The gathering was well attended, over a hundred members being present. During the proposal of "The Club" by Mr. F. Scriven, it was mentioned that the present membership of the club was 280, and, in addition, there were twenty-two honorary members. During the year fifty-six members only had been lost, despite the depression in Bradford's prosperity during the year. Mr. T. G. Bullus responded with a racy *résumé* of the club's doings in trials during 1921, and also paid a graceful tribute to the Bradford Gipsy M.C.C., which had assisted in the organisation of many of the events.

Mr. J. Conchar proposed "The A.C.U. and the Yorkshire Centre (A.C.U.)," coupling therewith the names of Mr. J. N. Longfield and Mr. W. A. Dovener, chairman and secretary respectively; the latter names were received with tremendous acclamation. During his remarks, Mr. Conchar predicted that the Yorkshire Centre Open One Day Trial on

June 17th would probably "out-Scott the Scott trial."

Toasts of "The Visitors," "The Press," and "The President," were proposed by Messrs. S. M. Haigh, C. Sidney, and A. R. Naylor respectively, and received suitable responses. The prizes were distributed by Mr. J. E. Fearnley, and the evening was closed by the ever popular Irish and Yorkshire ditties of the Dewhurst Bros.

A special feature of the evening was the tastefully printed menu, including a complete list of the club's 1921 competition results prepared by Mr. W. A. Dovener.

Birmingham M.C.C.

On Friday, January 13th, the club will hold its annual dinner, smoking concert, and prize distribution. Tickets, 12s. 6d. each, will be available shortly.

Levis Athletic Club.

On Friday and Saturday last an excellent variety entertainment was provided by the Levis Athletic Club at the Levis Works, Stechford.

The programme, which was well varied, and contained many topical allusions, concluded with a sketch entitled: "A Reliability Trial." This sketch, which was a clever skit on the real article, proved immensely popular. Mr. Alec Ross, who worked hard to replenish the coffers of the club, made the interesting announcement that the A.C.U. stock trial would start from the Ward End works of the Wolsley Co., and that, by the courtesy of Mr. McCormack, special arrangements had been made which would be of assistance to Midland competitors.

During the evening Mrs. Butterfield distributed prizes to successful competitors in club events.

Evesham M.C. and L.C.C.

The club held its first annual dinner at headquarters, the Crown Hotel, Evesham, on Wednesday night of last week. About fifty members and friends were present, and the Mayor of Evesham (Mr. W. A. Fisher) presided. After the toasts of "The King" and "The Prince of Wales," Mr. J. Howell, of Worcester, proposed the toast of "The Club." He said they of the Western Centre regarded the club as a rather precocious baby. They had among them that night Mr. Eric Williams, whom he considered the greatest rider this generation had seen. Mr. Morrall, their acting trials secretary, was a man of great promise. It was an honour to have the Mayor in the chair, and Mr. A. O. Brown, the donor of a cup, had come from Southampton for the event. Mr. G. J. Brotherton, the hon. secretary, responded, and spoke of the assistance rendered them by the Worcester and Cheltenham Clubs.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

VARIABLE EXHAUST NOTES ON TWO-STROKES.

Sir,—I recently required some new piston rings for my machine, and had to go some ten miles to get them. However, I started out, somewhat doubtful as to the running, as I had no bottom ring, and the others were badly worn. However, the machine behaved exactly as "Silenced" described, but ran very regularly, and did not lose power until the revs. fell very low. When new rings were fitted it ran as normally as ever. Now, when running with the throttle only slightly opened, if I open the air there is a curious swishing sound like the sucking of a carburetter, which continues as long as the air lever is fully opened. Can any reader explain this?

JEGLIDE.

Great Yarmouth.

Sir,—I have repeatedly found that once the engine of my machine (an old model Connaught) is thoroughly warmed up, by putting the gear in neutral, and closing right down the air lever of the carburetter with the throttle one-quarter open, I can get the engine to run without a murmur from the exhaust at about 600 r.p.m., and two-stroking all the time. Unlike your other correspondents, I have practically no power when running like this, as the least pressure on the flywheel will stop the engine. However, on closing the throttle slightly and opening the air lever, the engine will start the usual four and eight-stroke banging until the mixture is corrected, when it regains its usual burble.

From the above experience I should be inclined to attribute the other cases of silent running to a super-rich mixture, which will not explode, but burns.

TANTA.

Walton-on-Thames.

FLAKING OF MICA PLUGS.

Sir,—I have noticed for some time now letters from numbers of motor cyclists who write to you for advice on the subject of what they term "drying up." What this "drying up" means I do not understand, and never did, and I am perfectly sure that what they complain about is caused by self-ignition, which is caused by inefficient, defective, and badly manufactured spark plugs.

In addition to their "drying up" troubles, motor cyclists and motorists generally are suffering, and have been suffering for some time, from what they think is "seizing up." They can drive their motor cycles or cars gently, or, comparatively speaking, gently, for some distance, but when they arrive at a hill and open up the throttle, or even if they open up on the level, the engine, after a short distance at full throttle, comes to a sudden stop, but the engine is free immediately the starting handle or kick-starter is operated. This trouble is not due, of course, to "seizing up" but to self-ignition through these bad plugs. This self-ignition takes place so early that the piston has to compress the explosion, which, of course, it cannot do, and stops the engine dead.

I think it would be a good thing if you would use the influence of your widely read paper to warn motor cyclists and motor car users of these plugs; and I, on behalf of my company, wish to protect our productions.

When an engine so behaves, due to its faulty plug, the opinion of the majority of users is that it is the engine which is at fault because the symptoms are so like a "seize up" to most people, but they overlook the fact that an engine cannot change its mind! And if a stoppage is due to a seizure, it still remains seized when stopped.

The plugs which I have found to be the worst offenders are of the mica type, and the mica is wrapped. Why a

manufacturer will make a plug in this manner is absolutely beyond me. The wrapping is first done, apparently, in a cylindrical manner, and afterwards turned to taper shape, which turning exposes the underneath layers, and these layers begin to flake very early in their life, and often burst or flare open. The edges of these flakes become incandescent and cause self-ignition, in some cases so early that it ignites the gas while the inlet valve is still open, causing blowing, or popping back into the carburetter. Some of these plugs are detachable, and if the centres are detached very carefully, so as not to break or rub off the loose edges, the flaking can be seen.

THE M.A.C. ENGINE CO., LTD.

OSBORNE DE LISSA, Managing Director.

THE HIGHEST METALLED ROAD IN GREAT BRITAIN.

Sir,—Well knowing the district mentioned by your correspondent, I can quite understand him lifting the machine over boulders, heather, etc. The road he mentions is nothing more than a "moss road" (i.e., a road the natives use for bringing their peats down from the moss, or bog), and I pity the club that "finds" this "road" for a hill-climb or test.

The query, however, asks for the "highest metalled road," and by no stretch of imagination can one call this metalled, while the remarks with regard to scenery are somewhat misleading as it is very bleak and treeless after the farms are passed. The track is never used beyond these farms; while from Loch Bulig to Inchroary is merely a footpath, and not a good one at that. No; it is far better and quite arduous enough to get from Deeside to Tomintoul by the regular route *via* Gairnside, Cock Bridge, etc.

I still think the highest road can be found in Aberdeenshire; but this is the well-known Cairnwell from the Spittal of Glenshee to Braemar, with the famous hairpin bend known as the Devil's Elbow, and rises to a height of 2,200 feet above sea level.

L. FORBES.

A FINE ARRAY
OF PRIZES

It is not our rule to publish photographs of club prizes, but this array of the Newcastle and Dist. M.C. trophies and medals for the 1921 season is exceptional, and serves to show the enthusiasm of Northern motor cyclists in club life.

PRONUNCIATION OF "MAGNETO."

Sir,—There is no doubt that this is usually pronounced "magneeto," but about ten years ago I heard a paper read before the Institution of Automobile Engineers by Mr. F. W. Lanchester. This eminent authority pronounced it mag-ne-to, slightly emphasising the second syllable, but with a short "e."
E. SIMPSON, M.I.A.E.

HEAD LIGHT DIMMING ETIQUETTE.

Sir,—While "devouring" *The Motor Cycle* recently I noticed that the head light controversy is still raging.

It may be of interest to know that it is a law here that all head lights must be dimmed 150ft. from any approaching vehicle. Motorists appreciate the danger of glaring lights, and usually switch off about 300ft. from anything approaching.
EX-NB 9477.

Miami, Florida.

Sir,—The thanks of the motoring community are due to you for the prominence given in your journal to the subject of light dimming. A wider observance of this simple courtesy, would do much to render night driving safer and more pleasant for all.

I cannot quite see why nearly all subject seem to take it for granted

your writers on this that gas lamp users cannot reasonably be expected to reduce their lights under any circumstances. Any set of gas lamps can be arranged to dim quite satisfactorily if a little trouble be taken by the owner to spend the necessary few pence and few hours in fitting up a gadget that will enable them to reduce their light at times when it is a danger and annoyance to other road users.

Fig. 1.

Fig. 2.

taken this trouble is the writer's excuse for describing a dimming device which has performed successfully for some years past on his own machine.

The lamps fitted on the machine are an F.R.S. Major head lamp with a 21 litre burner, and a Lucas rear lamp with a 1/2 litre burner. When the sidecar is attached it carries another F.R.S. Major with 21 litre burner. All are supplied from a Low generator of motor cycle size.

To be quite honest, it was not consideration for other road users which first induced the writer to fit the dimmers, but rather it was a desire to reduce the 42 litres gas consumption in town, and when standing outside the house.

Various devices were first fitted which acted by impeding the flow of gas to the burners; but, whilst quite good for momentary dimming, they failed in town work by sooting up the burners rapidly.

Each head lamp was then fitted with a three-way tap and a pilot burner taking 1/2 litre, arranged as shown in fig. 1. This was successful in town, but did not solve the difficulty of momentarily dimming the sidecar lamp from the saddle. To overcome this defect, the sidecar lamp was fitted with a double supply pipe, as indicated in fig. 2, both lamps being now controlled from the one three-way tap.

The extra complication due to the use of the two small pipes on the sidecar is very little, and is quite paid for by the saving in gas alone.
KB 1112.

Liverpool.

[Car owners and their associations have now more or less come to a definite conclusion on this matter, i.e., that switching off entirely is unsafe, but that the fitting and using of dimming switches is to be encouraged. The R.A.C. has lately conducted trials of promising devices of this nature, and has issued certificates of performance. A number of these dimming switches are described and illustrated in the current issue of *The Autocar*. It only remains now for owners of vehicles with powerful lights to make the necessary conversions.—ED.]

"ECONOMICAL MOTORING FOR TWO."

Sir,—I enclose a photograph which may be of interest to your readers. I think I can claim that it is the only "combination" of this kind on the road. The gentleman's cycle is the Waltham Engineering Co.'s special cycle with their Young 1 1/2 h.p. attachment. This is coupled to the lady's cycle with a Unito rigid coupling.

The power of the engine is simply wonderful. I ran it all last season, and have been from London to Brighton and back comfortably in the day. With, of course, pedal assistance, we can get up all but freak hills with ease. On test, with the engine in best form, we have run from Ashted to Tooting without ever turning the pedals! I suppose that is with about a 20 st. load. It is very cheap to run, and the initial outlay is relatively small.

CLAPHAM.
London, S.W.12.

BICYCLE OR CAR?

"Clapham," in the accompanying letter, gives his experiences with these coupled pedal cycles driven (mainly) by a 1 1/2 h.p. Young motor attachment.

PREVENTION BETTER THAN CURE.

Sir,—If "Humber 1st" will mount his A.A. badge on his front mudguard, in front of the number plate, he will no longer get caught up in it.
A. BREDT.

IMPROVING AN A.B.C.

Sir,—I was much interested in a letter from F. Mason re "Improving an A.B.C." Being a well satisfied owner, and having got over the two difficulties he mentions, I should be very happy to help him out. The carburetter necessary is a Cox Atmos, but this will not tick over unless everything else is in proper order. The gudgeon pin fixings are discarded, and a large size (3/16 in.) copper rivet driven in each end of the pins. It is necessary that the gudgeon pin has at least 1/16 in. lateral play.
E. F. BEWERS.

MAXIMUM SPEEDS OF TWO-STROKES.

Sir,—I note with interest that one of your correspondents can get 44 m.p.h. with a Villiers engine. I should be very pleased to hear how it is done. I have a Villiers-engined Revere, new in December, 1919, and, although this machine is a paragon of reliability and a marvellous hill-climber, the highest speed I have ever touched (Johns-Manville speedometer) is 38 m.p.h., and that down a gentle slope with a following wind. Also, the engine does not like continuous driving at more than 25 to 27 m.p.h.
AR 8414.

London, S.E.18.

HINTS CONCERNING SCOTTS.

Sir,—In common with "Southerner," whose letter appeared in a recent issue, I should like to know how to get 98 m.p.g. with a Scott. I use a gear of 44 to 1 on top, Binks carburetter (jets .00, 1, and 8), and a lightweight sidecar, and obtain 45 m.p.g. I am fitting "hot air," and shall no doubt improve on the above. As regards easy starting, I consider the Scott the easiest of bicycles to start, and I have had several. My method is this. Stop up every single air leak, use No. 1 or aviation petrol if possible, half-retard ignition, open throttle half-way (Binks), cover up the intake with the hand, lift half-compression, and push the engine round quite slowly with the kick-starter (slower the better) a few times, and the machine will then start at once. When hot, open the throttle about one-quarter, give one gentle push, and then a smart dig, and off it goes.
P. CALLARD.

EXPECTED DEVELOPMENT IN IRELAND.

Sir,—I should very much like to bring under the notice of the trade the enormous possibilities of a greater sale of British machines in Ireland. Now that all the restrictions are taken off temporarily, and with the prospect of being removed altogether, there is a very large percentage of the Irish who are only waiting their chance to start the supreme pastime on a level basis with the Britisher. It is only a matter of a few months to get the roads in order again, and during that time I am certain that if manufacturers extended their agencies in this country they would find that they would get very many orders. In my opinion, the motor cyclists we have in this country are only a very small fraction of what there will be in the near future.

Dublin.

WORRIED.

MOTOR CYCLISTS IN DREAMS.

Sir,—If "Motor Cyclist in Dreams" would like to see the fulfilment of his desire, if he possesses patience, perseverance, and concentration he can, by visualising and holding the image of his desire strongly in the mental world, find in time that, according to the clearness of his mental image, and the persistency with which he holds to it, his desire of motor cycling will come along.

He should form a clear cut mental image, filling in every detail of the motor cycle and himself riding, even to the clothes he is "wearing," and with persistent patience and keeping the image ever present before him the realisation is bound to come.

This process is not to be confused with dreaming, which is only frittering away of the mental energy, and results in nothing, except loss of mental activity which could be turned to good account.

These are things which individuals can, if they desire, prove themselves.

MAUDE STANSFELD.

SIDECAR FUEL CONSUMPTION RECORDS.

Sir,—May I take the liberty of replying to Mr. Tom Hammond, in regard to "Ignoramus's" petrol consumption? I myself am riding a 1921 Triumph sidecar, an absolutely standard outfit, as delivered from the Triumph Cycle Co., with no alterations in regard to jet or anything else. My average is 88 m.p.g.—not a trip average, but week in and week out, and in the county of Derbyshire, always with a sidecar and passenger. Last September, after tuning up my machine, I took a trip average with sidecar and passenger, and out of one gallon and one pint of petrol I got 111½ miles, thus making a fraction under 100 m.p.g.

The secret of it all is: Treat your machine as part of yourself. Gear on the low side, say 5½ to 1 top, or not a fraction over 5½. Decarbonise every 700 miles. Do not half do it—give minute attention to your valves. Do not allow a speck to remain on the valve faces; also, always have good springs. Give the engine a pumpful of oil every six miles, do not run six, then seven, and then eight; let it have it regularly, by speedometer if possible.

ENTIRELY SATISFIED.

Derby.

WEIGHTS OF SPORTING MACHINES.

Sir,—With reference to "Triardo's" defence for heavy sporting machines in your issue of December 8th, I can only agree with the last part of it. Is he aware that the sidecar has been responsible for a lot of this weight—long wheelbase, large tanks, heavy frame, etc. If the 4½ h.p. Coulson, 4½ h.p. Hawker, Bat, and one or two other machines can be made within the 200 lb. limit (and a touring machine at that), should it be necessary for the sports models to be 240 lb.?

Again, take the 2½ h.p. sports Massey Arran at 173 lb. and the 5-7 h.p. flat twin Coventry Victor at 225 lb.

Until some line is made between a machine for sidecar use and a machine for solo work, and manufactured specially for one or the other, extra weight will always be burdened on the solo motor cyclist.

"Ixion" knows what he is talking about.

S. HENDERSON.

Sir,—As another prospective owner of a Ricardo-Triumph, I write to support "Triardo" in his remarks of the 8th inst. One of the outstanding points which recommended the machine to me was its substantial construction.

I have seen so-called "sports" machines led into garages suffering from the results of quite ordinary skids, with their frames twisted to an almost incredible degree. One instance stands out, being that of a 4 h.p. 30s. tax machine (60 m.p.h. (?) sports model), which had the whole steering head twisted as the result of an ordinary skid! Now then, "Ixion," what about it?

RICUMPH.

West Somerset.

GOOD BAD ROADS OR BAD GOOD ROADS?

Sir,—When I used to ride in England I was continually irritated by reading letters from the Colonies boasting of the bad roads overseas. I found this particularly annoying in June, 1919, when I broke three spokes and fractured my down tube on a Hounslow pot-hole, and read soon after that we were lucky to have the roads we had.

I have now covered 5,000 miles of Rhodesian roads, mostly thirty miles from the nearest railway, and although it is admittedly difficult to average more than 18 m.p.h., it is, nevertheless, far more pleasant riding than the English roads provided two years ago.

With the splendid clutch on my 4 h.p. Triumph, river drifts on the main roads present little difficulty, and even the sandiest roads are better than Mendip grease.

To sum up, roads which have not been "made" yet are far nicer than those whose Tarmac surfaces have been beaten into potholes and corrugations by lorry traffic; and, thank goodness, there are no tramlines.

S. Rhodesia.

OVERSEAS TRIUMPH.

[It is generally supposed that English roads have been considerably improved since 1919.—ED.]

A snapshot of wild monkeys examining a Big Four Norton. The photograph was taken on the banks of the Ugeni river, S.A., by Mr. J. L. Norton, who states that the monkeys were shy to begin with, but soon made up their minds that it was a good machine, and settled down comfortably, while he from his hiding place exposed the film.

COMPARATIVE INSURANCE RISKS.

Sir,—“Nicky Nicky Bom Bom” will perhaps appreciate that the only just basis for the assessment of motor cycle premiums is the individual rider's driving skill, and that they should be in inverse ratio to his degree of observance of the principle of “Safety First.” Since this is impracticable, and a basis of some sort had to be found on which to calculate premiums, the present system in vogue with insurance companies was adopted.

In this connection it is interesting to note that motor cycling insurance, from the insurance companies' point of view, still shows a heavy loss at the end of the year, and, as a result, rates for this class of insurance are likely to be still further increased.

Mr. Attwood Evans's statement that an 8 h.p. motor cycle is capable of more speed than the lower-powered machines argues that he is rather more of an insurance expert than an experienced motor cyclist. ENFIN.

Bromley, Kent.

Sir,—As one of those who, only by dint of scrupulous care, contrive to enjoy the freedom of the open road, through the medium of a motor cycle and sidecar, I am vastly interested in the subject of insurance as recently raised in your columns. I must confess to an ignorance on the subject. I have paid my premiums with much weeping and wailing and gnashing of teeth, and considered the cash thus disposed of as having depleted my possible mileage for the season. There must be many riders who, like myself, use their machines in a modest way, say, at the week end, and for only six months of the year. For this we pay a premium to cover the whole twelve months. Is it not possible to insure one's outfit for, say, April to September inclusive, at a somewhat reduced charge? Now that we are to be permitted to take out our licences quarterly (which will mean a saving of 30s. to such as I), cannot the insurance companies make some similar arrangement at a slightly higher rate than for the annual premium? ECONOMIST.

Reading.

FAMILY TRANSPORT MEDIA.

Sir,—I would advise “Family Man” (Woking) to give a Scott Sociable a real good trial before he finally decides on his next three-wheeler.

Our family consists of father (12 st.), mother (8 st.), son (eight years), daughter (six years), son (five years), and son (two years)—six in all—and I have covered over 4,000 miles to date, about half distance six up and carrying stove, food, fuel, etc., in proper comfort.

Incidentally, I have yet to see a two-seater sidecar attached to a motor cycle with a pillion that would give any comfort at all over 130 miles of average road to-day to any one of the four passengers.

I have never reached 70 m.p.g., although I get very near; but the Sociable is far cheaper to run than a first-class sidecar over, say, 5,000 miles. ANOTHER FAMILY MAN.

Manchester.

RELATIVITY AND THE PROP STAND.

Sir,—Might I suggest that prop stands should have a short spike on the ends? Using one of these on loose soil or mud with a flat end the machine is liable to fall over. Naturally, the spike would obviate this. A. BREDT.

Sir,—“Humber 1st” has given us a pleasant mixture of humour and pathos in recounting his experience with a makeshift prop. To the moral drawn by your correspondent one might add another pointing out the folly of using a makeshift when the real article is obtainable.

Unfortunately, a letter such as your correspondent's may convey to some readers an impression that a prop stand is not a safe thing to use; and, as a consequence, the general use of a really excellent fitting is thereby quite considerably retarded.

As the manufacturer of a popular prop stand, and as a reader with probably the longest experience of prop stands, I can assure “Humber 1st” that a correctly fitted and adjusted prop is not only very reliable, but is also a real boon to the solo rider. It is so delightfully easy to use that some riders seem to take a pleasure in using the prop quite unnecessarily, probably owing to a feeling of relief that the troublesome rear stand has been rendered obsolete so far as everyday use is concerned.

If the prop stand is well made and correctly adjusted to the angle and height of the footboard, there is no more useful fitting for the solo motor cycle, and certainly none that will give the rider such real satisfaction. Some inquirers appear to think a prop stand is not strong enough to hold up their machines, but we are repeatedly demonstrating that our all-steel prop will hold up a machine with a 14 st. rider in the saddle. A. ALTREE.

THREE POTENTIAL ENTRIES FOR A PRIVATE OWNERS' T.T.

Sir,—Having recently read the suggestion to hold T.T. races for private owners (no “shamateurs” wanted), we, the undersigned, are wishful to back it up. There are no events of this kind in which a *pukka* private owner holds an earthly chance, besides which entrance fees are prohibitive. Another point is that the course would be too long; ordinary sporting private owners are not used to 250 miles all out, and certainly do not wish to ruin their machines. May we, therefore, suggest that a course of sixty miles is sufficient, and that such a race would appeal more widely to the public than one in which non-standard machines are used and ridden by crack trade men.

We should like to finish up by hoping that the “Blue ‘Un” will give the suggestion all the help it can.

H. BEACON.

N. A. LINDLEY.

W. HAVELOCK POTTS.

LEVERS OR TWIST GRIPS?

Sir,—At any discussion of this question I have hitherto been conservatively partial to the levers with which I have been familiar for all the fifteen years during which I have been a motor cyclist. But the other week I had an experience which led me to re-examine on their merits the two methods of control.

The experience I refer to was a nasty spill—the first that has happened to me. (I touch wood as I tell it.)

I do not know whether the two dogs concerned were deliberately attacking me, or, perhaps in their canine way, endeavouring to escape from me. At all events, it was not easy to keep clear of both. *Incident in Scyllam qui vult vitare Charybdim.* In the event one of them just touched my front wheel, and, simultaneously, coincidence or result I know not, my rear inner tube burst, and I crashed.

The damage to horn and accessories was no more than was to be expected, but the personal injury was of a more serious nature. The needlessly sharp point of the exhaust lift lever had entered and gashed my left knee for a distance of 3½ in.

A twist grip on my machine would not have averted the spill, but it certainly would have saved the need for the surgeon's services and the four weeks' absence from office.

In any case, are not these levers needlessly sharp at the point? Why should they not terminate in a foil, or knob, or button? LK 369.

Gibraltar.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

CHOOSING A COMMERCIAL TRAVELLER'S MACHINE.

Q. I am taking up travelling for certain commodities as an occupation, and it is in connection with this that I expect to find a motor useful if not indispensable, especially as I shall have to carry a little stock with me. The district I shall be canvassing is hilly, and the roads are rather bad if one has occasion to leave the main routes. My means are very limited. What lightweights do you recommend me to look out for with this information in front of you? Please name a few, with their h.p. and prices, and then be good enough to tell me which you consider the pick of the lot. Presumably, one with more than one gear would be needed, and I should like one as simple as possible on account of the fact of being rather an amateur. In buying a second-hand machine, what points do I need to look out for? I understand that it is very easy to get "taken in" when purchasing such, and no one wants to lose more than is really necessary, especially when one has very little to lose!—S.L.S.

For your work a machine of between 300 c.c. and 500 c.c. cylinder capacity would be advisable. You would do well to study *The Motor Cycle Olympia Show report* for the most desirable mount for your work. Prices and all essential details were included in that issue. For obvious reasons, we cannot recommend one machine in preference to all others; if you could bring your choice down to three or four makes we would endeavour to advise if your selection is a suitable one. Before choosing a machine, we think it would be well if you obtained some better knowledge of the subject, and would suggest that you study the chapters on selecting a machine which are embodied in the latest edition of "Motor Cycles and How to Manage Them."

NO WONDER!

Q. (1.) I have a 2½ h.p. two-stroke (about 1916), and am constantly having trouble with the top piston ring, which carbons solid into its groove. I have had the engine down three times this season, and have on each occasion put in a new ring in this position, and always with the same result. On the last occasion (quite recently) the ring was carboned up solid in its groove after running only 100 miles, after taking the engine down and putting in a new ring supplied by

the makers specially. The lower ring never seems to trouble this way. The engine quickly gets very hot, and commences to knock badly when running on the flat with very little throttle opening. Is the carboned up ring the cause of this? (2.) Should the edge of the top of the piston be on a level with the bottom of the exhaust port opening in the cylinder when the piston is at the bottom of its stroke? At present it does not get down to this point by a full ¼ in. (the steep slope of the piston top is nearest the port).—F.W.S.

(1.) Gumming up of the top piston rings in two-stroke engines is rather a common fault, and it is difficult to overcome, although it should not occur so frequently as happens in your case. The only thing we can suggest is that you fit a ring having a good deal of up and down play, and also a fairly wide gap, so allowing the ring to be quite free in its groove. (2.) The top edge of the parallel portion of the piston should come approximately level with the bottom of the exhaust port. This can only be taken generally, as in all cases the ports are not machined and have slight variations. If the piston is fitted in your engine as described it is in the wrong way round, and this will

account for all the bad running of the machine. The steep side of the deflector should be next to the transfer port.

TWO-STROKE ADJUSTMENTS.

Q. Having just purchased a 2½ h.p. two-stroke two-speed Clyno, I find that, when run on the level, at about 25 m.p.h., the engine suddenly pulls up as though it had seized. This happened three or four times in a run of 100 miles, and I simply took my clutch out and then started off again in bottom gear, when the machine seemed to run well. I have tried various mixtures of petrol and oil during my run, but this did not seem to make matters any better. The machine spits back very badly through the carburetter if I give it very little air. (1.) I have a No. 24 jet; do you recommend trying another size? (2.) Would this trouble be caused by the plug points being set too close and overheated? (3.) Would it be possible for the float chamber to empty itself and again refill in the time of one minute, in which I had to stop? (4.) Would the bad spitting at slow speeds be caused by faulty timing; if so, will you kindly let me know the correct method of timing of this particular machine? (5.) When I operate the compression valve on the top of the cylinder there are a continuous number of bangs as long as this is left open. Can this be remedied? (6.) What quantity of oil should be mixed with a gallon of petrol?—G.C.T.

(1.) Try a No. 26. (2.) The trouble certainly appears to be due to pre-ignition, and in all probability the sparking plug is at the root of the matter. (3.) If there is any restriction in the petrol supply it is possible that the float chamber may be empty, and so bring the machine to a standstill. If the obstruction was something floating in the petrol it is quite likely that on the machine stopping the float chamber would refill again before you restarted. (4.) This is probably due to incorrect (weak) mixture or unsuitable sparking plug. The timing should be set so that the contact breaker points are just opening when the piston is on top dead centre with the control lever almost fully retarded. (5.) This is no doubt due to the compression valve not opening to its full extent; adjust the compression, release control wire, or renew if necessary. (6.) About one part to twelve by measure. If this proportion causes a smoky exhaust, cut it down to about one part in sixteen.

Important Dates.

- Mon., Dec. 26th, Tues., Dec. 27th—M.C.C. London-Exeter-London Trial.
- Sat., Dec. 31st—N.W. London M.C.C. Twelve Hours Open Winter Trial.
- Fri., Jan. 27th, to Sat., Feb. 4th—Scottish Car and Motor Cycle Show.
- Sun., Mar. 5th—Argenteuil Hill-climb (France).
- Mon., Mar. 6th—La Turbie Hill-climb (Nice).
- Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.
- Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.
- Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.
- Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.
- Fri., April 14th, and Sat., April 15th—M.C.C., London-Land's End Run.
- Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.
- Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.
- Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.
- Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.
- Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.

EASIEST WAY OF CORRECTING BALANCE

I possess a $3\frac{1}{2}$ h.p. Norton. Upon fitting a new connecting rod and piston, the flywheels balance them upwards. What is the correct method of balancing for speed? If the piston and connecting rod are too light, should I drill the flywheels or weight the connecting rod or piston?—H.L.H.

The new piston and connecting rod should be exactly the same weight as the old ones, and we would recommend that you make certain that this is so rather than tamper with the balance weights on the flywheels.

READER'S REPLY.

EXCESSIVE FOUR-STROKING.

I venture to give another solution of "E.A.M.'s" trouble on the above subject. I have a Connaught, and on one occasion it took to four-stroking badly, and I eventually found that the gauze in the air intake of my Amac carburetter was quite choked up with dirt. On cleaning this, the engine two-stroked again quite all right, and now I periodically clean the gauze in petrol, and have not had a recurrence of the trouble.—N.M.P.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"Miner" (Somerset).—Most economical carburetter and most suitable size tyres for 1913 Williamson.

"D.F.B." (London, N.W.8).—Flexekas on 4 h.p. Triumph, Low generator, and Challenger inner tube.

"T.W.G." (Manchester).—7 h.p. F.N.: Climbing, consumption (petrol and oil), passenger work, and general hints.

"D.W.M." (Falkirk).—3 h.p. Raleigh: Speed, consumption, and capability of light sidecar work.

"J.E.V." (Hatfield).—Maglita equipment on $3\frac{1}{2}$ h.p. Rudge Multi solo: Reliability and amount of light, and any other dynamo lighting that can be fitted to this machine.

"A.C.U." (Devon).—Dunelt with sidecar: Reliability, climbing, and maintenance of tune.

"M.M." (London, S.W.19).—General experiences of the Jupp open frame lightweight.

"G.F.R." (London, W.1).—1921 four-cylinder A.C.E., solo and with sidecar: Cooling, climbing, timing, and maximum speeds.

"E.R." (Lincoln).—Quadrant and Excelsior $4\frac{1}{2}$ h.p. single-cylinder outfits: Power, speed on hills, consumption, and general reliability.

"F.H." (Hounslow).—Reynolds runabout: General suitability for middle-aged professional man.

"A.B.G." (Edinburgh).— $4\frac{1}{4}$ h.p. spring frame Beardmore-Precision: Speed, reliability, consumption, and hill-climbing.

"V.E.W." (Eastbourne).—Experiences of running taxi-sidecars.

"D.F.L." (Oxford).—8 or 10 h.p. 1921 Blackburne, solo and sidecar: Reliability, consumption, etc.

"A.A.A." (Pontypidd).— $3\frac{1}{2}$ h.p. Rudge Multi, T.T. model: Reliability, gear efficiency, climbing, with and without light sidecar; also similar queries regarding 16H Norton.

"C.J." (Wembley Park).—Scott Sociable: Suitability for serious touring with two heavy passengers and luggage in very hilly country, roadworthiness, stability on grease, and general reliability.

SPARKLETS.

On the Track.

Dunlop tyres were used by H. H. Bowen on the occasion of his recent successes on a Martinsyde at Brooklands.

Insuring the Prince's Cars.

The fourteen Crossley cars used by the Prince of Wales and his suite during the present tour in India are insured with the Autocar-Fire and Accident Insurance Co., Ltd.

An A.C.U. Booklet.

The A.C.U. has issued a booklet entitled "Why You Should Carry the A.C.U. Badge," which extols the advantages of membership to the governing body, the address of which is 83, Pall Mall, London, S.W.1.

An American Two-stroke.

Cleveland motor bicycles are handled in this country by the branch office of the Cleveland Co. at 90, Cannon Street, London, E.C.4, the sales manager being Mr. J. W. Shillan, of Messrs. Shillan, Beck, and Co., Inc.

Fuel, Oil and Air.

The growth of the motor movement generally is perhaps best gauged by some of its smaller manifestations. Not many years ago the man who imagined a successful business from the retail sale of motor spirit and oil only would have been deemed ultra-optimistic; to-day, however, the first privately owned filling station exists. It is in Robin Hood Vale, on the Portsmouth Road, between Putney and Kingston. Castrol oils are supplied exclusively, and compressed air for tyre filling is gratuitous.

A Brooklands Speed Calculator.

Whether the Castrol Speed Finder is more of a blessing to the regular Brooklands habitué or to harried sub-editors revising the "copy" of irresponsible track correspondents, it is difficult to say. It consists of a card with concentric circles of times and distances, and a radial thread from a hole in the centre, which is used to co-ordinate the required figures. It gives m.p.h. on the 10ft. and 50ft. Brooklands lines, also m.p.h. over the mile, half-mile, and kilometre from known times. The Castrol Speed Finder was designed by C. G. Pullin, the well-known racing motor cyclist, and it may be obtained on application to C. C. Wakefield and Co., Ltd., 30-32, Cheap-side, London, E.C.2.

Catalogues Received.

Martinsyde, Ltd., Maybury Hill, Woking, Surrey: Between covers of somewhat unusual design, the Martinsyde catalogue gives valuable information concerning the various types of machines and the parts thereof.

Barimar, Ltd., 10, Poland Street, London, W.1: A folder dealing with their metallurgical process for restoring badly scored motor cycle cylinders.

Grindlay (Coventry), Ltd., Melbourne Works, Spon End, Coventry: A catalogue of the Grindlay sidecars, giving particulars and prices of the various models, which are made to suit all types of motor bicycles.

GRIM MOTOR CYCLISTS.

Arrayed as living skeletons, Birmingham University medical students recently paraded the city on motor cycles during a carnival and street collection in aid of the local hospitals.

No More Punctures!

You will never again be stranded with a punctured tyre—never again dread bits of glass, flint, and nails, if you fit the **TUBE PROTECTOR**.

The Tube Protector is a flexible layer of thin pieces of hard metal (arranged as in a coat of mail) enclosed in canvas, and fits between the outer cover and the inner tube of your tyre. No matter what sharp matter pierces the outer cover, it cannot penetrate the Tube Protector—cannot possibly pass through to the inner tube.

The Tube Protector is easy to fit, is light in weight, and causes no friction. It allows you to wear down the outer cover to almost nothing. Think of the saving in time, money, labour, and patience.

Ask your dealer to fit **TUBE PROTECTORS** to your motor cycle tyres.

"HINTS & TIPS FOR MOTOR CYCLISTS."

8th Edition

of this useful little handbook
NOW ON SALE

THE value of this book lies in the fact that it is informative, practical, and complete.

The numerous "wrinkles" and items of information it contains are time-savers, temper-savers, and very often money-savers.

Over 400 separate paragraphs are included, and these cover every imaginable subject relating to motor cycles, their management and care. Each paragraph is numbered, and there is a copious alphabetical index.

The book is really a short cut to experience. It embodies knowledge that has been acquired by numerous riders on many different types of machines—condensed into the most compact and convenient form. Of handy size (6in. x 3½in.), it can easily be slipped into the pocket or valise.

To the beginner, "Hints and Tips for Motor Cyclists" is an invaluable companion, while to the more advanced rider it is extremely useful for purposes of reference.

Price 2/- net. By post 2/3.

Obtainable from ILIFFE & SONS LTD.,
20, TUDOR STREET, LONDON, E.C.4.
And leading booksellers.

Christmas Gifts for Motor Cycle Friends

'Motor Cycles and How to Manage Them'

This is the most useful book that has ever been published for motor cyclists. It covers every conceivable subject relating to motor cycles, their care and management, and deals with everything the motor cyclist wishes to know. Especially valuable to beginners. Over 400 illustrations. Twenty-second edition. Price 2/6 net. By post 2/10.

'Hints & Tips for Motor Cyclists'

The value of this book lies in the fact that it is informative, practical and complete. There are over 400 separate paragraphs dealing with every imaginable motor cycle subject. Eighth edition. Illustrated. Price, 2/- net. By post, 2/3.

'Tracing Motor Cycle Troubles'

Every rider will appreciate the value of this book. It gives an ingenious system for tracing motor cycle faults, and of remedying the trouble when found. Fourth edition. Illustrated. Price, 2/- net. By post, 2/3.

Solve the problem of Christmas gifts by presenting your motor cycle friends with one or more of the motor cycle books or maps described here. Nothing could be more appropriate, more useful or likely to be more highly appreciated by the recipients.

'The Motor Cycle' Route Book

This is a welcome departure from the usual form of road book. In addition to the usual routes from London, it gives radiating main routes from other large and populous centres, also "linking up" routes from all other fair-sized places, together with thirty-two pages of maps. Price 5/- net. By post, 5/6.

'The Motor Cycle' Road Maps

Set of three maps—England and Wales, Scotland and London (showing roads into and out of London, and avoiding London)—complete in case. Price, 5/6 net. By post, 5/10. Set of two maps—England and Wales and London—complete in case. Price 4/6 net. By post 4/8.

'Two-stroke Motor Cycles'

By the staff of *The Motor Cycle*. This is the first complete treatise on the two-stroke motor cycle, dealt with from the rider's point of view. It shows the possibilities of the Two-stroke; how the engine works; how to tune it; how to secure efficient running and eliminate troubles. Freely illustrated. Price, 3/- net. By post, 3/3.

'Motor Cycle Reminiscences'

By "Ixion" of *The Motor Cycle*. It gives an amusing record of the author's own experiences in twenty years' of riding, and 200,000 miles on the road, and also contains a great deal of very interesting motor cycle history. Many unique illustrations, including fourteen humorous drawings. Price, 5/- net. By post, 5/3.

Q All the above books and maps may be obtained from the Publishers, *Iliffe & Sons Ltd.*, 20, Tudor St., London, E.C.4. If desired they will be sent direct to your friends upon receipt of remittance and addressed label. Kindly say if you wish them to be despatched on any particular date.

Motor Vehicles for Business Purposes

ANY readers of "The Motor Cycle" who are concerned with motor vehicles for the carrying or delivery of goods, or are interested in transport undertakings of any kind, should study the pages of "MOTOR TRANSPORT" each week

This journal deals in a practical manner with all aspects of motor haulage and delivery. It is equally useful to the owner of a single van or lorry as to those who own or control fleets of vehicles.

Reliable and helpful information is provided for users and prospective

users of motor road transport, for operating engineers and for drivers and mechanics.

Among the subjects dealt with are—Costs of Running various types of motor vehicles for trade and industrial purposes; Descriptions and Illustrations of new vehicles, components, and accessories, Care and Maintenance of business vehicles; Practical Notes for drivers and mechanics; Motor Transport finance, legal matters, etc.

A consulting staff is at the service of readers to give advice and information, free of cost on all transport matters.

HEIGH-HO THE HOLLY!

—this life is most jolly.

—you can get the very thing you want if you haven't all the money!

Come to the Service Co. and choose that machine you want, second-hand or new. Never mind about the cash,—the machine's the thing. Have it for the New Year. Only one fifth the full price need be put down. The rest, monthly to suit your convenience.

In the meantime we are booking orders for 1922 models of all makes and should be pleased to give you full information of new features, revised prices, etc., on hearing from you. We will make an unreasonably good allowance on your present machine and the balance can be paid on the easiest of easy terms. Our second-hand stock is carefully selected. Every machine overhauled and guaranteed.

Our service goes with every transaction and does not end with the sale.

Have a look through our new list. Ask us to send you a copy—post free on application.

289-293, High Holborn, London.

Philipson's

PATENT AUTOMATIC GOVERNOR

PULLEY

AND GEAR COMBINED

Philipson's Latest!

GOVERNOR PULLEY AND VARIABLE GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

2-stroke.	4-stroke.
LEVIS, O.K., CALTHORPE, VILLIERS etc.	TRIUMPH, NORTON, ROVER, SINGER, COULSON-BLACKBURN

We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.

Our Flywheel Governor converts a single-speed 2-stroke into a speed model—the lightest speed model on the market!

THE ONLY GEAR WITH NO END THRUST.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet

No gear box friction.
No grinding noises.
No wheels or pinions to chew up.

THERE IS NOTHING PERFECT

admittedly, but by concentrating in one direction it is possible to become a specialist and to know more about that particular subject than someone else who tries to learn the lot.

I deal only in Douglas Motor Cycles, Spare Parts, Repairs, and Specialities; therefore I know my subject well.

MY LATEST is a new rear spring for the 4 h.p. Side-car. It gives double the movement of the usual spring, and is twice as comfortable. Further, it is unbreakable, and carries 12 months' guarantee. Each spring, and invoice is numbered. If a spring breaks in this period, return the invoice and the broken spring, and I will replace it free. Isn't this fair? And the price is only 17/6—the price of a standard spring.

ZOOM! ZOOM!!
My wonderful Exhaust System is still the biggest seller of the day. It adds £10 to any 2½ h.p. Douglas, yet only costs 30/-; a little while back it would have cost 50/-, and a standard silencer costs to-day 37/6. Everybody is satisfied with them. Mr. Charles F. Staggs, Newport, writes:—"I received the pipe before the Speed Trials and was successful in gaining the Challenge Cup for the fastest time in the 350 c.c." I have made arrangements to produce 250 sets a week, and can send by return.

AIR-COOLED VALVE CAPS were originated by me. I have sold over 5,000 for 2½ h.p. and 4 h.p. Douglas Machines.—They prevent knocking, make your engine give full power on long hills, and let you drive "all out" without drying up. They were used by many T.T. riders, and the winners of the Grand Prix used them. Many have copied my design but cannot fathom my alloy. My price is 4/- per cap, and remember they are guaranteed.

POWER.
Do you appreciate more power, better petrol and oil consumption, better compression, and an engine that does not carbon nor gum up nor oil the plugs? If so, you should insist on fitting my Twin Rings, made under a patented process. They are the most scientific rings manufactured, and every one is guaranteed. 2½ h.p. 1/6, 4 h.p. 1/8 each. Racing men say "They are IT."

A CLEARANCE LINE of new and guaranteed Saddles (adjustable springs), which may be tensioned for any weight; beautifully finished solid leather top on steel pan; fits a 2½ h.p. frame perfectly, giving a low riding position, and does not foul the sidecar connection on the 4 h.p. Only a few left. My price, 25/-; elsewhere, 35/-.

I have lots of other Douglas Specialities, including Barrel Valve Springs: Racing, 2/- per pair; Touring, 1/6 per pair. Large Metal Armoured Solid Leather Two-strap Tool Bags for 4 h.p. Douglas, price 12/6, usual price 20/-; and for 2½ h.p. (smaller), 9/-—Only a limited supply. Black Inflators, fit Douglas Clips, 6/-; usually 8/6.

Remember, my service is a return service. Everything you order you get by return, and, if you are not satisfied, return the article, and your money is returned without deductions.—That's my policy!

ALL DOUGLAS MODELS demonstrated and supplied. **TRADE**—Send your enquiries.

THE MOTOR CYCLE Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

Dear Sirs,

Whilst I regret the incident of the fire which damaged my Motor Cycle Combination, I feel I must express my satisfaction for the fair and courteous manner in which you have dealt with this matter.

Yours faithfully,

The only Safe Test of Insurance is Claims. We settle Claims promptly.

The BRAMPTON Bi-Flex SPRING FORK

SINCE a spring Fork can only absorb vibration and shocks effectively in the direction in which it is capable of movement, the liberal margin of movement in both the horizontal and vertical planes which the exclusive design of the Brampton Bi-Flex facilitates, will be readily appreciated. The Brampton Bi-Flex Spring Fork is instantly responsive to, and completely absorbs within itself, all vibration and shocks from every angle at which resistance is encountered, rendering the rider immune from discomforts which are otherwise impossible to entirely eliminate.

BRAMPTON BROS., Ltd.,
Oliver Street,
BIRMINGHAM.

To our many
friends—a
Greeting!!

ANOTHER Christmastide has come round—bringing with it the close of yet one more year, its record of things achieved—and, above all, of new friends to add to the ever-growing community of those who have met us, dealt with us, and found our friendly ways of doing business to their liking. To me, this friendliness in business is one of the great prizes of life. I do believe that it was never intended that there should be no more in it than the making of a sale, the gaining of a profit. To give service for service's sake, letting the reward take care of itself, is, I am sure, by far the better way. My reward, our reward, is in the great fact that our customers are our friends—and that there are literally thousands all over this country, and in every part of the world, who have pleasant recollections of Layton's. As they do not forget us, so do we always remember them. To keep the lamp of our good name ever well-trimmed and brightly burning—to maintain undiminished, to develop to greater perfection in the future, the qualities that have commended us to those who have given us their trust and patronage in this past—this is the sincerest way in which we can express our thanks to those friends, old and new, who in letting us serve them have honoured us.

WILL YOU THEREFORE, all of you, wherever you may be, accept our thanks and our gratitude in this spirit; and may I, on behalf of my firm, as well as for myself, wish you, both for this Christmastide, and the coming year, the "Best of Everything that matters."

J. W. Collady,
General Manager.

SIDECAR HEATER.

List No
S18/115.
Price
complete
45/-

**THE "CELERIO" SIDECAR HEATER & HAND WARMER**

is a great boon for long distance or night riding. It consists of a foot muff and a hand warmer. The muff is lined with thick, warm felt, and heated by pure hot air from the heater, which is attached to the motor cycle exhaust pipe. All fittings are heavily plated, and the apparatus is easily and quickly fitted.

**THE 'DUCO' GREASE GUN**

By reason of the special construction of the plunger, can be used for injecting grease by force—and oil or spirit (by air pressure)—the latter being sucked into the syringe by means of the upper inverted washer. 7 1/2 in. long x 3/8 in. dia. List No. S75/34, 2/3 each.

"CELERIO" MOTOR CYCLE WATCH

is most reliable, and as illustration shows, is neat in design. Complete with handle-bar clip fitting, nickel-plate or black. List No. W2/27, 17/6 each.

These Accessories are obtainable from all Garages and Motor Dealers.

**MASCOTS.**

This Indian Head Mascot in solid bronze is of exquisite finish, and beautifully chased and enamelled. Commemorative of H.R.H. The Prince of Wales' Canadian and American Tour, 1919.

List No. M11/161.
Enamelled, 25/- each.

MOTOR CYCLING HELMETS

ensure protection against cold and rain, and greatly facilitate comfortable riding during the winter months.

In tan leather lined
Llama wool.
Fitted protective
ear rolls.

List No. C47/16.
8/10 each.

List No. C47/17
Lined satin.
7/6 each.

THE "CLERO" MECHANICAL HORN.
A strongly made horn, designed expressly for motor cycles. Simple construction, nothing to get out of order. Diameter of bell, 4 in. In black finish, complete with bracket for handle-bar or top tube fixing. List No. H8/16.
18/- each.

PRICE

17/6

PER PAIR.

**LONDON—EXETER**

Many well-known riders fortified themselves against this cold ride by fitting the "John Bull" Muffs. You should profit by their experience.

THE NEAREST WAY TO SECURING COMFORT

whilst motor cycling in wintry weather is to make certain that the hands are kept warm.

Several unsuccessful attempts have been made to design a real air and weather-proof muff which will afford complete protection to the hands and wrists, at the same time allow of thorough lever control, but it has been left to the

"JOHN BULL" Handle-bar MUFFS

to solve the difficulty.

The "JOHN BULL" Muffs were introduced at Olympia, where they met with immediate approval from the trade and motor cycling public alike.

They are most simple to fit—are beautifully finished with glossy black rubber—are warm and attractively lined, and are suitable for all types of handle-bars except the straight T.T. pattern.

Ask your Agent for details, or write to us.

Night--& the Slow Moving Wagon

The slow lumbering cart, with its driver half asleep, occupying the middle of the road, and looming suddenly ahead is a common experience in night driving.

The danger is real, but it can be confidently overcome by fitting Royal "Ediswan" Automobile Lamps, which pick up all objects hundreds of yards before they are reached. Royal "Ediswan" Lamps for brilliance, economy, efficiency, and durability have a world-wide reputation.

Ride easy at night by installing

"EDISWAN"
ROYAL
AUTOMOBILE LAMPS

A.J.S.

—the outstanding
exhibit at
OLYMPIA!

Extracts from the Press.

The Popular A.J.S.

"Probably the most difficult Stand in the Show to approach is that of the A.J.S. The new model $2\frac{3}{4}$ h.p., no less than the 7 h.p. Combination, attracting such a crowd that only a few in the immediate neighbourhood of the machines can inspect the new designs. The smaller type is shown both as a solo and sidecar, and in addition a rakish-looking sporting model. The 7 h.p. is exhibited with single and double seated passenger attachments."

—"The Motor World," Dec. 2nd, 1921.

"The A.J.S. Stand reigns alone in this year's Olympia display—and indeed of all Olympia Shows ever held. The ever-moving masses of humanity which constantly surround this Stand, instantly prove that the public at large have appreciated the significance of this achievement."

—"The Irish Cyclist and Motor Cyclist," Nov. 30th, 1921.

"The A.J.S. Stand arouses more than ordinary interest. The road and track successes of this make have been phenomenal."

—"Daily Express," Dec. 1st, 1921.

It can be stated without fear of contradiction that there was no more popular stand at the Olympia Motor Cycle Show than the "A.J.S." It was the **OUTSTANDING EXHIBIT**. All day long throughout the week, it was besieged by eager throngs. The reason for this popularity is not far to seek. During the past season, no other make of Motor Cycle performed so consistently and carried off such honours as the A.J.S.

The two-fold success of the $2\frac{3}{4}$ h.p. model in the T.T. Races, and the Outstanding Merit of the 7 h.p. Passenger Combination in Open Reliability Trials made the A.J.S. exhibit of more than ordinary interest and importance.

The Press Extracts quoted at side will fully substantiate our statements.

If you were one of those who did not get a chance to examine the A.J.S. at Olympia, you can do so now by asking for catalogues of the $2\frac{3}{4}$ h.p. and 7 h.p. models. Both are fully illustrated and described.

To present A.J.S. Riders.

If you are contemplating having your Machine overhauled for the coming Season, the best time to send it to us is now.

A. J. STEVENS & Co. (1914), Ltd. Graiseley House Wolverhampton

London Agents: H. Taylor & Co., Ltd., 52-53, Sussex Place, South Kensington, S.W.1.

Lower Essex Street,
BIRMINGHAM.

OMEGA

The 3 h.p. Motor Cycle.

Bristling with novelties—neat design—strong duplex frame. Power unit can be taken out rapidly—front fork can be adequately lubricated without annoyance—tank fixing novel—T.T. or upturned bar at will—full of sensible originalities—amazingly cheap.

In addition, it has a wonderfully efficient engine, and mud-guarding which makes the Omega essentially an all-weather utility mount—the Motor Cycle you have long been looking for.

From 66 Guineas.

SIMPLY A MATTER OF PRESSING THE BUTTON—

**THE RUNBAKEN
Spark AMPLIFIER
AND TESTER!**
(Patd. 13980)

This highly finished accessory is quickly fitted to any type of plug, and with its aid, besides giving the generally recognised advantages of an extra spark gap in the high tension current, has also the following advantages:

1. Confirms Magneto and High Tension Wire O.K.
2. Will cut out cylinder for testing purposes.
3. Acts as thief-proof device.
3. Never necessary to take out Plugs except when faulty.

NO MORE PERPLEXITY:
8/6 each. Post Free.

Write for leaflet A/E.

2. Definitely enables you to see a spark take place at Plug Points.
3. Whether sparking regular or not.
4. Whether points sooted or insulator cracked.
5. Indicates "shorted" Plug.
6. Will cut out cylinder for testing purposes.
7. Acts as thief-proof device.
3. Never necessary to take out Plugs except when faulty.

PER
1'6
TIN

*This prevents belts slipping
in wet weather*

There is only one cure for belts slipping in wet weather, and that is "Erusa." This works wonders with belts of all kinds. "Slip" disappears, and engines pull better. You can get a belt treated with

ERUSA

soaking wet, and it will not slip. "Erusa" differs radically from sticky dressings. It's an internal waterproofer and preservative. Get a tin and prove it.

If your dealer cannot supply, send 1/6 plus 4d. postage, and we will forward a tin by return.

THE REVELATIONS OF THE TRIALS

The wonderful successes in the recent A.C.U. SIX DAYS TRIALS of the NEW ROVER and CONNAUGHT Teams again brings to the notice the benefits to be derived from the "BONNIKSEN." All these machines were fitted with this type of Speedometer, and the general opinion of the riders emphasises the assistance derived from the use of the Instrument, as the following extract from a letter will show: "All Connaught riders fitted a Bonniksen Speedometer and found them very satisfactory. My personal views on them are that they leave nothing to be desired. They helped me very much in keeping to scheduled times, and I relied wholly and solely on them for the speed test at Brooklands."

—can you Build— a Motor Cycle House?

"The Amateur Mechanic" which is indispensable for the householder, is almost invaluable for the Motor Cyclist—it shows him how to clean, repair, and overhaul his machine. It also presents useful directions on how to build a Motor-Cycle house. Materials (batten covered with matching) are described; how to cut the points and to fix them together—how to make the back frame, the door frame; the closed end, and how to cover all the frames with the deal match-board; how to make the roof—to board the back, the closed end, the front, the upper part of door frame—How to get the whole together, to make the window, etc. This lesson has 12 "How to do it" pictures and diagrams and specification of quantities and prices of materials required. Everything is so plain that, as one buyer writes:

"A child could understand these directions."

The Amateur Mechanic

**Presents 400 Money - Saving
Lessons, including:**

—To waterproof cloth, coats, etc.—To make bird cages, aviaries, etc.—To build poultry houses, cycle sheds, workshops, etc.—To cut glass bottles—About glues and varnishes—To make syphons—To make hearth-rugs from strips of cloth—To make rubber stamps—Home-made drilling machines—How to make a leather suit case—How to upholster old chairs, couches, etc.—To fit a house with electric bells; with speaking tubes—To repair and clean sewing machines—To put a white enamel finish on furniture—To polish shells and pebbles (for necklaces, etc.)—To make incandescent mantles—How to make a mattress—To make and mend boots and shoes—To make a pair of hand-sewn boots—To repair broken windows—To cure a smoky chimney—To repair a plaster ceiling—To make a tiled hearth—To tile walls—To repair water taps—To make a child's folding mailcart—To overhaul and repair a Cycle, a Motor Cycle, a Motor Car—How to do ticket and sign writing—To repair barometers—Simple metal-turning, gilding metals, etc.—To erect a sundial at home—To make a hot-water towel rail—To mount maps—All about the various operations in boot repairing; putting on new toe-caps, heel patches, ankle supports, back lining, etc.—To cure damp walls—To ebonise oak—To stuff and set up birds, animals, etc.—To grind razors—To make a wooden harp—To repair faults in domestic hot-water supply—To protect water pipes from frost—To paper a room—To make a camera—Wood inlaying, etc., etc.

"The Motor Cycle" says:

"In this work we come across special articles which should interest our readers, such as those on Filing, Screw-cutting, (whether by lathe or by hand) How to Use Spanners, Metal Turning, Metal Spinning, an article on the Overhauling of the Motor Car, another on the Motor Cycle, another on the Bicycle and Cycle, Taper Turning, Home-made Drilling Machines, Emery Discs, Bobs and Wheels, Hardening—and one on Fitting up a Workshop for Motor Repairs. The motorist and cyclist will find much to learn from this well-written and copiously-illustrated work. We have had a copy of 'THE AMATEUR MECHANIC' in our possession for some years, and many useful hints and tips have been gathered from it. It should find a place in the library of every practical motor cyclist."

WONDERFUL EFFICIENCY—ASTOUNDING VALUE.

NEW IMPERIAL CYCLES LTD.,
PRINCIP STREET, BIRMINGHAM.
(Est. over 30 years.)

ARE YOU WAVERING as to your sidecar family mount? If so, allow us to put before you the NEW IMPERIAL 8 h.p. Combination, which has many points in its favour and which has a great number of satisfied riders—

Its Engine is the famous New Imperial J.A.P. with ample power, and fully loaded will crawl with the safety of a car in traffic, and develops speeds which you do not expect from a car; the Gear Box has three speeds with easy chain, the working parts being in ball bearings, and the gear ratios just suitable to the power developed; a Shock Absorber is also embodied, giving, with its all-chain drive, flexibility and smooth running at all speeds; the Back Wheel has Timken Roller Bearings, and these are **guaranteed for two years**; the New Patent Spring Seat Pillar gives the spring comfort of a car.

The *Sidecar* is roomy, with luggage cupboard at the back, and well-designed, the springing perfect and the Chassis scientifically designed; it has a cleverly cam spring loaded stand which is actuated by foot instantaneously. The resultant qualities of this combination are—simplicity of control; extreme comfort and its capacity for long and continuous work without deterioration and Perfect Dependability.

LONDON SHOWROOMS

4, BERNERS STREET, W.1

(Opposite Bourne & Hollingsworth.)

CONVENIENTLY situated in the heart of the West End, in a position easily accessible to Londoners and visitors to the capital, are some of the best appointed showrooms in England—those of the P. & M. Motor Cycles—where present and future P. & M. riders will always receive that service and attention which they rightly expect and which is given ungrudgingly.

Trained salesmen and demonstrators are there, eager to give RELIABLE first-hand information on all past and present models. Sectional gear boxes and engines enable the novice to see and understand the mechanism of the motor cycle, whilst demonstration machines are always ready to give actual proof of the P. & M. claims.

An exhibition of a complete range of machines and sidecars is a permanent feature, and our showrooms provide every facility for the convenience and comfort of visitors who desire to study the latest improvements in P. & M. Motor Cycles.

You are invited to favour us with a visit. You will find it both interesting and instructive, and it will place you under no obligation whatsoever.

The P. & M. Repair Depot at 17-19, Edge Street, Notting Hill Gate, offers complete service and advice on adjustments and repairs, which are carried out cheaply, effectively, and expeditiously.

The Trade View of the T.T. Dates.

LAST week we discussed the dates selected for the T.T. Races, viz., Tuesday, May 30th, and Thursday, June 1st, i.e., the week prior to the Whitsuntide holiday. Since our comments appeared we have received many letters from prominent members of the motor cycle world, and, without exception, the opinions expressed conform with the views advanced in these columns. There seems little doubt, indeed, but that strenuous efforts will be made in order to effect some modification of the proposed programme if the event is to be thoroughly representative of the trade.

There are two main reasons why these dates are unfortunate; first, the annual London-Edinburgh Trial is timed for the day following the Senior Race. The M.C.C. event has for many years proved one of the most popular holiday trials, and always attracts a large entry, larger, in fact, than most open events, and prospective competitors will have to decide between their visit to the Isle of Man to see the Tourist Trophy and taking part in the long-distance trial to the north. These alternatives will not appeal to the majority. It might be just possible for really enthusiastic riders to hurry away from the Senior race to compete in the long-distance road trial, but it does not seem likely that many will do this. It is also suggested that the Edinburgh run provides excellent training for a strenuous road race. But the outstanding objection is that the proposed dates fall in the week preceding the Whitsuntide holiday—the busiest week of the year for motor cycle factories.

Retarding Output.

It must be remembered that any firm supporting the Tourist Trophy races, if they have serious designs on the coveted prize, must devote considerable time and energy to preparations, and that for perhaps three weeks before the races their

best riders, testers, tuners, and repairmen will be absent from the works.

This will make a serious difference to the number of machines which can be produced before the holiday, when buyers are usually clamouring for delivery.

In some cases, of course, the competitions and commercial staffs are quite distinct, and in such cases the proposed dates would not cause inconvenience. At the same time, the fact that such conditions prevail in some factories rather places the less fortunate manufacturer at a disadvantage. The wealthier firms may always make better arrangements to promote success than those concerns which are only able to spare their best men for a limited period. To hold the races during the pre-holiday week would cause many seriously to consider whether they are justified in sacrificing their output at this time in what, at the best, is a gamble for fame. All keen motor cyclists desire to see a fully representative and sporting event, and it would be deplorable if an unpropitious date were selected which would have the effect of reducing the entry list.

The R.A.C. and the A.C.U.

If the races could be postponed for a fortnight the situation would be greatly relieved. There are difficulties in the way owing to the dates assigned for the car races, but surely these are not insuperable, since the R.A.C. is the parent body of the A.C.U. If the R.A.C. were approached, and the matter clearly and reasonably explained, it should be possible to arrange dates convenient to all. Alternatively, the races might be held earlier, or later, after the roads had been repaired subsequent to the car races. There are difficulties in each case, but, again, we fancy they are not insuperable. In any case, the opinions of representative manufacturers cannot well be ignored by the Auto-Cycle Union, and we feel confident that that energetic body will reconsider the dates proposed with a view to satisfying the wishes of the majority.

Occasional Comments

by IAN

White v. Black.

WHAT a relief it is to turn off a tarred road at night when visibility is low, and to open the throttle on white macadam, which gives the head lamp a chance to do its best. Always a regular night rider from necessity rather than choice, in the old days before tar was invented I used to love night work when the white roads were dry, and to dislike it when wet had dulled their sheen and reflective powers. Our head lamps are not orthochromatic. Keen eyesight is required to differentiate between (a) a cyclist, (b) a bullock, (c) a hedge, and (d) wet macadam or any sort of tarred road, for the distinction must be made by *form* rather than *colour* at night, whereas in daylight colour contrasts supplement the contrasts in outline. Does anybody know any orthochromatic device? I have heard it asserted that the Fallolite lamps differentiate colour to some extent.

Strafing the Puncture Fiend.

IFIND—so do most riders, I fancy—that punctures come in fits and starts. During 1921 I was lucky.

To judge by past experience, 1922 would therefore bring me large crops of flat tyres just when I least want them. So, by way of insurance, I am busily testing out everything which offers any promise of immunity. The Challenger tube taught me last season that only a fool regards punctures as inevitable. My list of specifics for test includes Impervo, Punkho, the Jeff tube (rubber flaps, which are blown up against the hole from the inside), a mystic tube by Bramco, of Coventry, the Monie nailsweeper, and so on. But I met with a shock when I went to Rapson's place, fully prepared to purchase a rear cover complete. The salesman informed me that Rapson had ceased the manufacture of motor cycle tyres. Let us hope it is only because his car tyres tax the plant, and that later on he will show us what he can do for two-wheelers. In the meantime, the simplest road to tyre joy is to fit 3in. covers; they don't often stop you, and they make some amends for the crimes of our road authorities.

A Real Motor Cyclist.

WE quasi-amateurs who buy a new machine at least annually; the professionals who seldom stir abroad without having kept a small army of mechanics busy on their 'buses for days beforehand; the "pals" of some tradey person who get delivery of a picked mount—how little we deserve the title of "Motor cyclist" compared with some of the unknown stalwarts who blush unseen in the remote

provinces. For instance, on my desk there lies a letter from a Midlander who is running a single-gear 3 h.p. combination. It is single-gear because the Armstrong three-speed hub wore out after 25,000 miles, and funds are not as yet available for a new gear. Incidentally, he obtained the machine by buying second-hand bits and building it himself. Along similar

lines he has built no fewer than four monocars. The first was constructed in 1910 from the wreck of a Rover tricar. The second was half built when the army took the designer to its bosom; and his chassis was sawn up during a week's leave to mend the garden gate. The third was a washout, for he incautiously tried to make a three-wheeled buckboard out of ash laths, and found that the frame whipped. The fourth—shudder ye competition magnates!—is to have *single-gear flat belt drive* with a jockey pulley in lieu of a clutch. One presumes that Howard Davies and George Dance would have to hide their diminished heads if this kind of fellow was ever let loose with unlimited cash upon the competition world.

Prop Stands and Deflation.

THE correspondent who signs himself "Humber 1st" is a sort of junior Einstein. Readers may remember his point, which is that if a prop stand supports a motor bicycle at an angle very nearly vertical, and the back tyre proceeds to deflate slowly when the owner departs, the machine will gradually assume a vertical position and presently topple over. This is obvious, and was covered in my recent article on the subject by a stipulation that a good prop stand should be moderately splayed out, attached midships, and well out from the centre line of the track. A prop stand affixed at a steep angle to the rear chain stays would certainly let the bicycle down under the conditions described by "Humber 1st." A decent sample will *never* let the machine down. I am encouraged and comforted by this reader's verdict that if prop stands become standardised, 80% of us would use them in the garage as well as by the roadside.

Automatic Cut-outs for Dynamo Lighting.

SOME of the cheaper dynamo lighting outfits are normally marketed without any automatic cut-out, though it is naturally an easy matter to specify a cut-out, and to wire it into the circuit. The novice may not appreciate the facts which govern the adoption or rejection of such an accessory. Where

Occasional Comments.—

a cut-out is omitted, *cheapness* is always the motive, and I believe I am right in saying that no car installation is now sold minus a cut-out. Two risks confront the motor cyclist who fits an outfit without this accessory. The first is that when he leaves his machine in a garage or by the roadside, some loafer may throw his charging switch "on," in which case the accumulator will rapidly run itself down by discharge through the dynamo. The other risk is that he himself may forget to turn the charging switch off at the end of a run, when the accumulator will similarly empty itself. In other words, an automatic cut-out is well worth its cost, and is really a necessity for a man who is not extremely precise in his habits and who often leaves his machine in any public place.

The "Stick-on" Type of Dynamo Outfit.

A FIRM of dynamo manufacturers write me kindly but plaintively to the effect that too many riders and writers ignore all types of lighting dynamo except those which are combined with the magneto. There is some excuse for this common omission. The lighting ignition systems necessitate no extra drive or brackets; they merge into the clean outlines of a good design, whereas the attachment of belts and pulleys and platforms is apt to disfigure a machine which has been thought out as a good-looking whole by a designer with some eye for beauty. On the other hand, it must never be forgotten that some of these "stick-on" dynamo sets come out at a far lower price than the *de luxe* combined equipments,

even when the cost of the ignition unit is set off; quite a good "stick-on" outfit may be bought for about £11, complete with lamps. Further, we ought to consider the case of a man who has a roadworthy but antique mount, and who yearns for electric lighting. He is already provided with a magneto, and its exchange value may not exceed a couple of pounds. The purchase of a sound "stick-on" installation is easily his cheapest path to the fulfilment of his dreams.

Head Lamp Bracket Fixings.

YEARS ago we could not temporarily remove our head lamp sets unless we also unscrewed the rather complex clips by which lamp, bracket, and generator were affixed to the handle-bar. Then somebody sensible came along and devised the more modern type of clip, which enables you to take off the lamp set by detaching two nuts, whilst the handle-bar clips "stay put." Latterly, a number of firms, comparatively new to the motor cycle industry, have revived the bad old type of clip, sometimes through sheer ignorance, sometimes in the interests of cheapness. The point is not radical—there are lots of riders who carry their lamps all the year round. On the other hand, there are other riders who wisely carry lamps only when lamps are likely to be used. A modern lamp set may cost anything up to £10, and it is pretty sure to be damaged if the machine falls over, as most machines do sooner or later. So it is a sensible precaution to leave the lamp set at home, whenever a daylight return is certain. Hence the buyer should frame his own policy in this matter.

To remind fair weather riders that spring and summer lie ahead—that the wet roads and leafless trees of to-day are with us for so short a period that it is not worth while to lay up the machine for the winter. To the real enthusiast there is no motor cycling season

How Valve Timing Affects Petrol Consumption.

Some Facts concerning Overlap, Lag, and Tappet Clearances

THERE are many ways in which the average rider sets out to effect economies in the running of his machine, but it is rarely that one ever hears of a rider taking any particular interest in the matter of valve timing. The carburetter generally plays the most important part in the experiments, which often effect a considerable and true economy.

There are two chief causes of petrol loss that may be debited to the account of the valve timing. First the ejection of petrol through the carburetter air port, as a result of blowing back, and secondly inefficient scavenging of the exhaust gases.

Overlap and Blow-back

The first of these causes of waste is essentially dependent upon the inlet valve timing. Now one often hears a lot about "overlap," but it is generally spoken of with regard to very high speed work, and here it is certainly permissible. In the case of producing economical running, however, care must be taken that this overlap is not carried to excess, and it is usual that overlap of only 2° or 3° be given. The first essential of the setting of overlap depends upon the closing of the exhaust valve. Should the exhaust valve close 8° or 10° past the top dead centre, then 2° or 3° overlap can be given, but in the unusual event of its closing before top dead centre, then the inlet valve must be opened rather later down the induction stroke in order to allow any exhaust gas remaining in the cylinder head to reach atmospheric pressure by further expansion—thus any serious blow-back will be avoided. In other words, overlap must be caused by a late closing of the exhaust rather than by an early opening of the inlet valve. Now as regards the closing of the inlet valve. It is natural to imagine that the end of the induction stroke is the correct moment for the inlet valve to close, but, owing to the high velocity and inertia of the gas in the induction pipe during this stroke, the inlet valve can be closed several degrees past bottom centre. This late closing varies considerably in different types of engines, and largely depends upon the size and lift of the inlet valve employed. Care must be taken, however, that the late closing is not carried too far, because if the cylinder is completely filled before the valve closes, "blow-back" will certainly be produced by the backward surge of the mixture as the piston reverses its movement.

Getting Rid of the Exhaust.

Dealing with the second cause, this depends upon the exhaust arrangements, the exhaust valve timing, lift, and size of valve and arrangement of exhaust passages. It is usual to open the exhaust valve from 40° to 50° before bottom dead centre, because when the piston has reached this point, it has more or less

completed its effective working movement. There is, therefore, no objection to an early opening of the exhaust valve, and there are certainly many advantages. The slight but ineffective—so far as useful work is concerned—pressure in the cylinder at this early opening is utilised to institute a flow of gas along the exhaust pipe, and the inertia effect of this gas-flow assists the emptying of the cylinder when the piston is rising on the exhaust stroke.

Early Opening Exhaust Valves.

A second reason for this early opening is that the piston would otherwise encounter a back pressure, nearly equal to the pressure upon it before it reached the bottom of the firing stroke, which would not only cause a considerable loss of power, but would cause overheating by the retention of the hot gases. In the same way that the velocity of the fresh gas surging through the inlet pipe is utilised by a late inlet valve closing, so is the momentum of the exhaust gas employed to assist in clearing the cylinder head by allowing the exhaust valve to remain open after top dead centre. Thus, any gas that may remain in the combustion head at the top of the exhaust stroke is given every opportunity to be released. It is essential that no obstruction should exist in the exhaust port and passages, otherwise any effective exhaust timing will be nullified. The exhaust pipe and silencer must be periodically cleansed of any carbon formation, in order to avoid back pressure. The necessity for complete scavenging is very important, and it will be clearly understood that any exhaust gas that does remain in the cylinder very seriously depreciates the quality of the incoming mixture. Exhaust gas is composed of carbon monoxide or dioxide to a great extent, and as these gases are not combustible they retard the burning of the petrol mixture.

Tappet Adjustment.

The correct adjustment of the tappets is very important. Any error in setting the clearances has a marked effect both upon power and fuel consumption. Adjustable tappets are provided for taking up any wear in the valve mechanism, such as the rocker and the tappet rod, and also any shortening of the valve stem. Excessive adjustment should not on any account be used to correct the valve timing, because by doing so the lift of the valves will be affected. It is advisable to verify the tappet clearances at frequent intervals, particularly on small high-speed engines. The makers' advice should always be followed as to the clearance necessary, and it is advisable to reset the adjustment with the help of a feeler gauge. Perhaps, on the 1922 machines, this gauge will be part of the standard toolkit—manufacturers, please note.

(6) The familiar Scott mudguarding arrangements. (7) Enfield lightweight foot screens. (8) Valanced guards on the big New Imperial. (9) Simple shields on the lady's model Ivy

CARRYING the SPARE WHEEL

Methods of Mounting an Extra Wheel and Tyre.

THE spare wheel has come to stay; there can be no doubt about that. Its usefulness—almost necessity—has been demonstrated to motor cyclists, and the demand for sidecar outfits equipped with detachable and interchangeable wheels, with accommodation for a spare, is considerable.

So far as British machines are concerned, it is chiefly in lower-powered, lower-priced, and sporting machines that its absence is the rule, although there are certain outfits sold at figures near 100 guineas which include spare wheel. Those which do not carry a spare wheel frequently carry a spare cover, and accommodation must be found for this; a cover improperly secured will quickly chafe and be ruined.

A Discarded Location.

Prior to the war a common position for the spare wheel was on the off side of the back carrier, the wheel being secured to the rigid part of the frame at a point where it was subjected to more vibration than it would have suffered at any other point of the machine. In the last Scottish Six Days Trials the Matchless outfits were so equipped, but these machines had spring frames. Nevertheless, when the same team figured in the A.C.U. Six Days a month later, the spare wheels were fixed to the rear part of the sidecar body.

With a Note on Accommodating Spare Covers.

This rigid fixing is unsuitable for present-day roads; the weight of the wheel, its rigid mounting, and vibration to which it is subjected, may cause fractures in the mountings, and the wheel is very liable to come adrift. The writer once saw one roll into a hedge, the driver of the outfit being none the wiser until overtaken by a following soloist.

Benefiting from the Springing.

A fixing for a spare wheel which is very popular is on the body between the sidecar and the driver, and thus receives the full benefit of the body springing. This position possesses considerable advantages, in that it leaves entirely free the rear sidecar locker and luggage grid, and does not interfere in any way with the hood. Some riders object to this position on the score of appearance, which, however, can be much enhanced by fitting a leather-cloth wheel cover.

A position which is daily becoming more popular is with the wheel across the track of the machine. The standard model Matchless, the Blackburne, and Excelsior sidecars are familiar. In this position the wheel may be tilted in order to permit access to the locker, or it may be fixed to the luggage grid, thus lying horizontally when the grid is in use. The Rex Co. fit the spare

METHODS OF CARRYING THE SPARE WHEEL.

(1) On the Dunelt the wheel is carried on the underside of the bulbous back of the sidecar, permitting free access to the locker. (2) A 1921 Matchless method—on the outside of the sprung carrier. (3) The 1921 8 h.p. Chater-Lea had the wheel bracket on the front of the inside longitudinal member of the chassis. (4) On the underside of the folding luggage grid—the 8 h.p. Blackburne.

(Left) A low position on a tradesman's carrier. (Centre) On the top of the bulbous back of a sporting Rex outfit. (Right) At the rear of the boot of the Acme outfit.

wheel in a vertical position at the rear of a boot.

Two recent patents have produced a method of carrying a spare wheel or tyre which possesses many good points. The wheel is entirely enclosed, the bulbous back of the sidecar containing a compartment at the side for the reception of the wheel or tyre; in the case of the former, support is given by a central spindle.

The wheel or tyre is thus protected from the elements, cannot be lost, and yet is instantly accessible. At the same time a sidecar embodying such a housing is pleasing to the eye, the bulbous back giving a graceful effect. The track of the 8 h.p. Sunbeam sidecar illustrated is but half an inch greater than standard, owing to the utilisation of every fraction of an inch in the chassis and suspension.

The weight is not increased, owing to the absence of a luggage grid and spare wheel bracket; public demand will demonstrate whether an enclosed spare wheel finds favour.

Another novel method of accommodating the spare wheel has been patented by a

Between the carrier and the sidecar is the position selected by the designer of the Royal Ruby

The same remarks apply when the spare cover is tied to the rear of the sidecar body, where it is

generally an eyesore owing to the attempts made to preserve it by wrapping it in canvas.

Quite a number of motor cyclists carry the spare cover, folded and strapped, in the nose of the sidecar, but when space is restricted this inconveniences the passenger.

England's registered sidecar body with side locker for spare wheel

A DIFFICULT SECTION.

IN *The Motor Cycle* of December 1st, 1921, we described the (alleged) highest hard road in Great Britain, a deplorable track near Tomintoul, which we stigmatised as unfit for inclusion in a Scottish Six Days. An Aberdeen enthusiast states that the road ought certainly to figure in next year's event, but that the riders should be allowed three hours as their

minimum time for the eight miles, which they must not be asked to cover non-stop. On these terms its inclusion would, he considers, form a highly sporting and popular feature. It might do. I have a kind of foreboding that my favourite grandmother will expire on the Saturday before the trials, if the Edinburgh Club considers this foolish suggestion. IXION.

The Cheapest Form of Touring

How a Reader Constructed a Trailer Caravan. His Holiday Tour and what it Cost for a Party of Four.

IN past issues of *The Motor Cycle* there have appeared illustrations of collapsible trailer caravans which must have interested many who can only just afford to run a sidecar, and who are yearly faced with the cheap holiday question.

As I could not afford to buy one of these outfits, I set out to construct one, and my experiences may be interesting and helpful to others.

Old army bedboards, which I could obtain easily and cheaply, provided the timber for the framework. These were sawn into lengths $1\frac{1}{4}$ in. wide (after planing), and the four main girders were made of these lengths, using half-cut joints and small nails. These proved to be very rigid even when only one nail was used at each joint. (The rear member had the middle portion cut out later, to permit easy entrance.) The four girders were then jointed together at the bottom of the well by two lengths cut 2 in. wide, and along the top in two places by $1\frac{1}{4}$ in. strips.

Framework Construction.

The whole framework was then strutted as shown in the diagrams, and extra strengthening pieces were placed under the seat portions and along the floor of the well. Three-ply wood was used for the floor and seats, and the far end of the well was also boarded in. Small nails were used.

The sides of the well are of canvas—the same material as the top and sides. For this I bought two ex-Government waterproof sheets size 13 ft. x 10 ft. each. These proved large enough for the caravan, and left a sheet about 9 ft. x 8 ft., which formed a really splendid covering for the outfit. Cloth-

covered pins were used to fix the canvas. A shaft $2\frac{1}{2}$ in. wide connects the trailer to the sidecar frame, and a bolt forms the hinge. The axle is a straight tube with the sidecar axles brazed in, and passes through the well just above the floor, and is covered by a box allowing ample movement. The wheels were supplied by a London firm, as were also the Douglas sidecar springs on which the trailer is slung.

Four folding feet steady the caravan when camping, but for perfect safety we always placed a petrol tin under the doorstep, and also left the caravan attached to the machine. The framework of the top is built up entirely of bedboards, the bent strips being $\frac{1}{2}$ in. thick, and bent by steaming. This was done by supporting each end and hanging a weight in the middle. The end top girders were strutted as shown.

Room for a Party of Four.

Four $1\frac{1}{4}$ in. pillars hold up the roof; these are hinged on a bolt at the bottom, and slipped on a similar bolt at the top and secured by a wing-nut. The hems cut off the canvas sheets formed splendid cross-braces for the sides and ends. These acted so well that when erected the top was very firm and tight.

CONSTRUCTIONAL
DETAILS OF OUR
CONTRIBUTOR'S
CARAVAN.

By a study of these drawings, any one handy with carpenter's tools should be able to construct the body. The complete framework is shown minus the upright stays.

The Cheapest Form of Touring.—

Four ropes were also attached to the buckles which secured the top when travelling, and acted as guy-ropes, which proved very useful on windy days.

The centre portion of the caravan is filled by a table 2ft. 6in. x 2ft. 2in., which stands on folding feet, and is a foot higher than the seats. This can also be used outside, and makes a meal a much more comfortable affair than the usual camping arrangement, and when used inside there is ample room for a party of four to sit round it.

Another piece of three-ply covers in the remaining portion when required, giving a sleeping surface of over 5ft. x 6½ft.

Having two old covers and tubes, I did not trouble to buy new tyres, but used gaiters over the bad places.

This trailer was only hurriedly finished on the morning of August 17th, and at 4 p.m. that day we set out on a seventeen day tour of Norfolk and Suffolk.

The Machine and its Equipment.

My machine is a Scott 1913 model, and the sidecar a Watsonian. I lowered the gear to 4.93 on high and 9.08 on low. My smallest boy sits on a seat slung over the passenger's knees, and the other boy is, of course, on a Tan-Sad.

We carried a large ordinary wool bed, large enough to cover the full space, and two large bolsters and two pillows. Sheets, blankets, and other bedclothes enough for adequate comfort were also taken, and we never felt cold, although the doorway was left open all night.

In the well underneath we carried a large bag of clothes, a full-sized Primus stove with spirit tin and spare paraffin tin, a large bucket, frying pan, large pan for boiling, and a soldier's "canteen." Another box contained the crockery—large and small plates, cups and saucers, etc.—and cutlery, enough for the four of us, and in a journey of over 400 miles we never had a breakage. A third box held bottles and jars for butter, jam, tea, sugar, etc., and still another held bread and provisions. Boot brushes and other personal equipment were not forgotten, and also a Thermos, candles, small medicine chest, etc.

Sleeping Arrangements.

The well also held a large enamelled wash-basin, an axe, a two-gallon petrol tin, a gallon tin of oil, the sheet for covering the motor cycle and sidecar, a spare suit of motor overalls for myself, and the lady's spare raincoat.

As none of us are tall, we found that we could sleep very comfortably in a row across the width of

the trailer. When travelling, the bed and bedclothes were spread out flat under the collapsed roof, but when camped during the day we rolled the bed to the far end, and folded the bedclothes on top of it. This allowed the table to be raised, and left plenty of sitting room for four.

Rambling Round the Eastern Counties.

Twenty-nine miles was our first day's mileage, our destination being Woodhall Spa, in Lincolnshire. The next day we ran to King's Lynn, the third day to Culford Park, near Bury St. Edmund's, the fourth through Stowmarket to Stonham Aspal, and the next to near Orford, where we stayed three days with friends. On the ninth day we again set off, and arrived at Kessingland, near Lowestoft. The following day saw us camped half-way between Yarmouth and Caister-on-Sea, where we stayed two days, when

we ran across the Broads to Cromer, and camped for the week-end on the cliff tops at East Runton. The Monday afternoon saw us at Hunstanton, and—the next day we toured through Sandringham to King's Lynn and on to Long Sutton.

We had intended staying near Boston, but owing to the terrible shortage of water we could not find a suitable camping place, so we had to travel another twelve miles until we got to a

place where water was plentiful. Next day was our shortest run, as we only ran to Woodhall Spa, and agreed to stay for our last night at the site of our first night's camp, and an easy run next morning (September 2nd) brought us home once more.

The Machine's Performance.

Speed and hill-climbing? Well, on the middle jet of the Binks, using jets Nos. 00, 2, and 7, we could easily average 15 m.p.h., and the middle jet sufficed for all except really hard work.

Only twice was the Scott stopped. The first time was between Stowmarket and Wickham Market. We got into one of the Suffolk "holes," and after descending a winding little hill and rounding a sharp bend dead slow, we were suddenly faced by a rather sharp little rise. I had to shed my passengers and start up again, and ride the outfit to the top alone. This route was "arrowed" as though for a trial, and consisted of winding lanes, with loose surfaces in places.

Our other failure was at Blakeney, on the run from Runton to Hunstanton. I was really sorry for the machine that day, as we were faced the whole way by a strong head wind. In a run of about forty miles

The trailer caravan erected. By comparison with the group of figures its roominess will be appreciated. The complete cost was only £11 5s. 6d

The Cheapest Form of Touring—

I had to use full throttle nearly the whole time, and even had to go on low-gear on the level several times because of the strong breeze. No one will be surprised to hear that I used nearly two gallons of juice that day, and I was not surprised when we stopped on this little pimple.

Many people asked, "What about the rain?" One night we had steady rain until eleven o'clock next morning, and two heavy thunderstorms the next night failed to show any impression on the covering, and, as we slept two feet above the ground, the weather bogey did not affect us.

We used the machine several times without the trailer for short sight-seeing runs and shopping. Mileage done was about 430, and the total cost of our holiday for petrol, oil, and all actual living and camping expenses was just over *ten pounds* for the four of us. Of course, pocket money and amusement

expenses are not included, but simply travelling expenses, food, and whatever was spent in accommodating the party.

What the Caravan Cost.

Lastly (and in this case the least), we come to the cost. The following table shows the cost of the trailer:

	£	s.	d.
Bedboards	10	0	
Three-ply wood	2	0	0
Two sheets of canvas	3	15	0
Wheels	3	2	0
Springs	17	0	
Axle tube and brazing	7	6	
Cloth-covered pins	4	0	
Blacksmith's work	5	0	
Sundries (bolts, etc.)	5	0	
Total	211	5	6

In short, the whole holiday was inexpensive, and we look forward in confidence to future trips.

GEO. A. WEATHERILL.

WINTER WEAR.

What to Wear on a Winter's Day, when Cold and Wet have to be Resisted.

A MEMBER of the N.U.T. staff, who is out all the year round in the bleak northern areas, recently told me that he has tried the following kit during the last three winters:

FEET.—Army wool socks and Canadian field boots.

LEGS.—Light cotton pants, heavy woollen pants, riding breeches, and oilskin leggings.

BODY.—Light cotton underclothes under heavy woollens, woollen and cotton shirts with double-breasted sheepskin vest between them, and D.R. coat and poncho.

HANDS.—Woollen wristlets, woollen mitts, and leather gauntlet gloves.

NECK.—Woollen muffler.

HEAD.—Storm helmet.

EYES.—Airman's goggles.

In addition, he tried a pair of airman's electric gloves obtained from the Disposal Board, but found they developed a hot-spot over the backs of the hands. He finds no defects of comfort with the above kit, except that the feet get cold, that the outfit is very heavy and expensive, and that it is a long job to get into it or out of it.

Ex W.D. Clothing.

Our contributor "Ixion" stated recently that he used a Sidcot suit, infantry gum boots, R.A.F. helmet, and Archangel field force gloves. A Sidcot suit is lined with teddy bear, and covered with waterproof twill. Its main drawbacks are that it is only made in stock sizes, and so may not fit the random buyer too closely round the neck, which is always a vulnerable point in wet weather; and that the waterproof twill is not always a genuine drencherproof in solo work, though it can always be trusted in the comparative seclusion of a sidecar or cycle car.

Both these kits are recommended by practical rough-riders. Can we add anything to their winter lore?

In the first place, it is obvious that nothing resists wind like leather, and nothing resists rain as oilskin does. It is no bad plan to warm one's body with leather, *e.g.*, leather trousers or breeches, and a sleeved leather waistcoat. Dryness can then be simply attained by the cheapest and coarsest oilskin suit, which will not imply heavy expense when it tears, as

all cillies do sooner or later. But the "teasiest" parts of the body have yet to be dealt with—the head, the feet, the neck, and the hands. So far as headgear goes, only one garment will really keep out heavy rain. It is the oilskin helmet, made in one piece with a face hole and a neck curtain. It makes the wearer look like nothing on earth, and should therefore be carried in the pocket or the sidecar till snow or rain signal that the time has come to don it. In dry weather, any lined leather T.T. helmet with sausage ear rolls will be warm and sightly.

The neck has already been catered for by the face-hole type of helmet. Riders who dislike making abject guys of themselves must make shift with a muffler; but it will always get soppy on a bad day.

Protecting the Extremities.

The foot problem varies according as the rider's circulation is good or bad. Men with sluggish circulations ought to eschew riding in arctic weather. For a man with an ordinarily good circulation, snow boots over ordinary boots, plus two pairs of good socks, will suffice. For a man with moderate circulation, gum boots are better. Either gum boots or snow boots are waterproof inside and out; therefore water will run down the legs and drain *into the boots*. This must be stopped by wearing waterproof leggings over the tops of the boots; if oilskin trousers are selected (and very few leggings will fit *over* big boots), a pair of cyclist's trouser clips can be used at the ankles.

The hands are an acute difficulty. Apart from the Archangel mitts, I only know of two waterproof gloves which are still obtainable. The Asbestol mitt is even heavier and stiffer than the Archangel type. Dunhills make a lined glove, of which the outside is waterproof twill. They made me a pair to measure, but I have only worn them once, because they were so stiff that I could not grip bar or levers with any comfort. I believe the best solution for the moment is to rely on one of the patent handle-bar muffs to keep the hands dry, and to help in keeping them warm. Inside the muff one can wear any thick non-waterproof glove.

ROAD RIDER

A HALF-DAY JAUNT INTO WALES

A forced dismounting in the lane leading to the falls resulted in this pleasing snapshot.

A Visit to the Highest Waterfall in Great Britain.

WITHOUT holding any particular admiration for George Borrow, that learned tourist-author of seventy years ago, I have read and re-read his "Wild Wales" with a peculiar delight because of a fairly intimate knowledge of many of the tracks he followed.

Many times, however, have I regretted an inability for one reason or another to visit what is perhaps the finest fall in Wales—Pistyll Rhaiadr.

Recently business took me to Shrewsbury, and left me with half a day to spare, so I hurried away with my $2\frac{3}{4}$ h.p. Douglas on to the Oswestry road without any very definite knowledge of the route or the distance. By a process of following signposts and an indistinct memory of the map of this district, I turned away through the quaintly named village of Knockin, and soon found from the milestones that Llanrhaiadr was not an hour's run.

"The Full and Awful Name."

The nearest village to the fall, to give it the full and awful name inscribed on the map, is Llanrhaiadr-ym-Mochnant; just what it means I must leave to a Welshman to explain.

It must have improved since Borrow's time, for it certainly does not merit his reference to "a dirty little street." True, there is nothing to enthuse over, for, were it not for its proximity to the fall, it would be merely another of the many pleasant Welsh villages with fearsome-looking names.

A narrow turn to the right commences the winding lane to the fall, two miles of very fair surface and not particularly hilly; no one should hesitate, fearing

lack of power, for it is quite

an easy road right to the foot of the fall, but there are two or three gates to open.

With regard to the distance of two miles, this was given on enquiry in the village, but was qualified with the reminder "but, look you, they are Welsh miles, indeed." I expect that it is nearer three miles, to be correct, and Borrow calls it four. It terminates at the fall, which is the most prominent feature in view for the last half mile.

Laboured description is out of place here, and anyone who does not know it might do worse than read Chapters 65, 69, and 70 of "Wild Wales." A few snatches from this talkative description will suffice:

"The water comes spouting over a crag of perhaps two hundred feet in altitude between two hills, . . . groves of pine are on the lower parts of both. . . . What shall I liken it to? I scarcely know, unless it be an immense skein of silk agitated and disturbed by tempestuous blasts. I never saw water falling so gracefully, so much like thin, beautiful threads as here."

A Drop of 210 Feet.

The total height is about 210ft.; the farmhouse standing near the bottom of the fall is to all appearances an improvement or rebuilding of the house mentioned by Borrow. He says: "As I drew near, two handsome dogs came rushing to welcome the stranger." Whether they were the descendants of those

A Half-day Jaunt into Wales.—

animals I do not know, but the sound of my engine brought four fine sheep dogs bounding over adjacent stone walls with a particularly boisterous welcome.

This waterfall, Pistyll Rhaiadr, has none of the roaring turbulence of the Swallow or the Conway Falls, when they are in full spate; it has a graceful and mysterious grandeur of its own, partly by reason of its setting in almost fantastic surroundings. I would recommend any tourist who is visiting North Wales to spend a few hours deviating from the usual ways of motorists to see this lesser frequented "lion" of the Berwyns; it lies but twenty miles off the Holyhead road at a point ten miles beyond Shrewsbury, and it is only another seventeen miles on to Bala; the tourist from the west and south may find it from

Ludlow *via* Welshpool, and, for easy roads, turn left at Llynclyst a mile or so before reaching Oswestry. From the north an easy way is by Chester, Wrexham, Chirk, Oswestry, to the same turning at Llynclyst; but there are numerous by-way variants of these routes waiting to be explored.

A striking point of this beauty spot is that as yet it is unspoiled; no glaring notice-boards proclaim its whereabouts, no admission fee is charged to view, and I hope, fervently, that the land owners will retain it in its natural beauty for many a long day. Commercial exploitation with the attendant disturbance of char-à-banc traffic would shatter the romantic enchantment of this glen of the Rhaiadr, as it has done in many another gem hitherto hidden away in some odd corner of this old land of ours.

WESTERNER.

TOWARDS GREATER COMFORT.

Some Notes on Improving the Riding Comfort of a Standard Machine.

ANY strange machine necessarily feels uncomfortable on first acquaintance. After 100 miles or so the rider grows accustomed to it, and is then in a position to judge its absolute comfort. If he be a youngster and a hard rider, he will probably consider there is nothing to complain of. If he is middle-aged, he will probably conceive a rooted dislike to bumpy roads, suffer from sundry aches and pains after any really long run, and decide to study comfort more intelligently in his next purchase.

Motor bicycles are like the fabled bed of Procrustes—they are built in a fixed standard size for tall and short occupants: But marked improvements in comfort can be effected at no cost by adjusting the riding position. The available adjustments which are possible include:

1. Adjusting the handle-bar (vertically).
2. Adjusting the saddle (vertically and longitudinally).
3. Bending the handle-bar.
4. Adjusting the footrests (in any direction).

Handle-bar Positions.

The first adjustment is easily the most important. If the bar is too low, or too far away from the rider, undue weight may be thrown on his wrists, and the backbone may have to take the thrust of the head and shoulders at an unnatural angle, which results in a "crick" across the small of the back. The bars should be adjusted until so much weight is taken off the wrists that the rider can sit straight up when he wishes. When this adjustment is made, the saddle will quite possibly be unsatisfactory. It is inadvisable to set it too far back, as this tends to exaggerate skidding. It is inadvisable to raise it appreciably, for this lifts the centre of gravity, enhances skids, and gives the rider's legs less power and comfort when he is straddling a stopped machine. As the saddle is usually delivered in the foremost and lowest position, the handle-bar adjustment should be made first, and the saddle left where it is, if possible; it is often necessary for a tall man to shift it backwards or buy a new bar. Riders who exceed 6ft. sometimes have to fake their saddles or even buy a new saddle, as the bridge at the rear sometimes prevents the saddle

being set back far enough for their knees to clear any rational handle-bar. Such radical measures should be taken *promptly*, as a bar or saddle can be exchanged gratis when brand new, but heavy expense is involved if once the useless parts are soiled. It is for this reason that the possibility of bending the handle-bar was mentioned above. If the rider does not discover the defects of his delivery bar until such a date that the makers may refuse to exchange it, it can be bent. Bars of first-class steel, such as a Triumph, can be bent cold; bars of lesser quality or heavier gauge material require heating.

Position of the Footrests.

When bar and saddle are right, the footrests may require attention. Two pairs are the ideal, giving change of position on long runs. If footboards are used, it is always pleasant to have instep bars on them—easily made of wood, and then covered with rubber.

When the position is perfect, the machine may still be uncomfortable, as the result of excessive road shocks or vibration. The surest method of improving the insulation is to fit the biggest tyres which can be coaxed inside the frame and mudguards. It is not a cheap expedient, but it is thoroughly well worth doing on a machine which it is intended to keep. The difference between a standard Scott (one of our most comfortable machines) and the special Scott with 3in. tyres is incredible; the latter is fully equal to any spring frame on the road. A cheaper and easier expedient is to fit such a special saddle as the Brooks cantilever or the Terry or Tan-sad. The immediate effect of this is to intercept most shocks received from the back wheel, and by contrast those received from the front wheel seem all the sharper and more frequent. Nor must the outlay on big tyres be regarded as sheer extravagance; they are actually cheaper in the long run than standard size tyres, as they very seldom puncture, and their life is extraordinarily long. The ideal combination is, therefore, a good machine, perfect adjustment of the riding position, oversize tyres, and a super-saddle. Nobody who has sampled such an outfit will ever describe motor cycles as uncomfortable.

B.H.D.

How the Hunting Man regards the Motor Cyclist Follower.

By J. FAIRFAX-BLAKEBOROUGH, M.C.

IN almost every hunting county in England the ubiquitous motor cyclist is turning up at meeting places, and not merely enjoying the run to the tryst and the picturesqueness of a meet of hounds, but endeavouring to see something of the day's sport from highway and by-way with the aid of his machine. This has roused the ire of hunting folk, and some masters of hounds have witnessed the increase in the number of motor cyclists with such concern that they are discussing the desirability of making all their appointments at places away from the main roads in order to shake off the sport-loving motor cyclist. Earl Fitzwilliam, who is Master of the Grove and the Wentworth Hounds, publicly called attention a few days ago to what he considered a menace to fox-hunting. Here are some of his lordship's words:

"I would like to see more young men participating in fox-hunting, but I am all against following hounds on motor cycles. There is a great tendency for motor cyclists to head foxes, and I recall a case last season when a number of misguided but enthusiastic cyclists spoiled a good run."

An Old Prejudice.

Those who are interested in rural pursuits—and the motor cycle has made many townsfolk intimate with and keen upon country life and sports—will in many cases recall that there was a tremendous outcry against the motor car at its inception on the part of hunting folk. It was to bring the chase to a sudden end, or, at any rate, be a serious drawback and handicap. There were those quaint old squires who refused to advance with the times, and who called motors "devil's carriages" and those who used them much harder names. They conscientiously believed that hounds would be killed and foxes headed, that the whole of rural England would be so petrol-stained that there it would be impossible for hounds to follow their fox owing to lack of scent, and so on, and so on. Most hunts at this early period of the history of the motor car issued official announcements as to whether cars were allowed at fixtures. Then

came evolution. Hunting folk began to send on their horses and themselves start off an hour or so later in their cars to overtake them. Masters of hounds overcame their prejudice and bought motor hound vans, and now every fixture of hounds becomes something like the "parks" of motors we used to see in France during the war. That is what familiarity has done!

A Sport for All.

It will probably be the same with motor cycles, though it is hardly likely that the horse brigade will use them as a means of getting to the starting point, though we have many of us seen both sportsmen and sportswomen in full hunting kit brought to fixtures in sidecars. Fox-hunting has always been pointed to as the most cosmopolitan sport in the world. The peasant on an old crock or on foot meets the peer on a three-hundred guinea hunter on equal terms. All and sundry are free to enjoy the sport in their own way and in accordance with their own means, provided they do no damage and observe the rules of the game. Now, apart from the consideration for the agriculturist (by whose sufferance alone hunting continues), there is a code of regulations, unwritten but understood, regarding the conduct of the sport itself. A man may not shout and "tally-ho!" unrestrainedly when he sees a fox, inasmuch as it may not be the hunted animal, or may have broken in a direction which the master for some good reason does not want to hunt.

The man who heads a fox; that is to say, turns a fox from the route he has decided upon and possibly causes him to run into the pack, or the pack to over-run the line he has taken, and thus cause a check, lays himself open to a reprimand from the master, the suppressed anathemas of the huntsman, and the eloquent scowls of the field. It is in this connection the motor cyclist is considered a spoilsport. Occasionally he may be so just as a passing ploughman, a postman on a push bicycle, a tramp, hawker, or farmer on his way to market might be, though none of these had any intention of taking part

The Motor Cycle and Fox Hunting.

the hunt. Foxes, of course, do cross highroads—sometimes three or four times during a run. They also cross railways, and only last week several hounds in one pack were killed by a passing train. These are all incidents and accidents in connection with the chase which are looked upon as part and parcel of the game. There is no sort of suggestion that trains should stop, or that those using the King's highway should become motionless when they hear the horn in the distance, on the off-chance that a hunted fox may be coming their way. The odds are against the likelihood of them in any way interfering with the sport on foot.

The Adaptable Fox.

Similarly with the motor cyclist. The odds are against the probability of those who endeavour to see a run from their machines being in the particular point in a road at the psychological moment that a fox endeavours to cross. The possibility is that, even were they at that particular point at the particular moment, a fox which had made up his mind to creep through the hedge would do so despite the on-coming motor cyclist. Animals have a wonderful knack of adapting themselves to altered conditions, and foxes are probably now almost as familiar with the car and motor cycle as are horses and other livestock. They have adapted themselves to the times and to evolution. Whilst one believes that motor cyclists would not be guilty of willingly spoiling sport, and would pull up if they caught sight of a fox coming

The odds are

Towards the covert.

at right angles towards them, it is an anachronism to expect the ever-increasing number of motor cyclists to feel themselves excommunicated from the roads of such parts of the country as hounds may be hunting. There must be tolerance on both sides. The motor cycle has come to stay, and a few tactful words of explanation from the master to the knights of the wheel who turn up at fixtures would have a more useful influence than derisive speeches.

Appealing to Sportsmanship.

Every motor cyclist is a sportsman. Supposing a master of hounds rode up to the group of motor cyclists at one of his meets and said, "Glad to see you chaps here. We intend to draw such and such coverts, and I should be awfully obliged if you would all keep together on the road at such and such a point, so as to let our fox get away. If you follow on afterwards, it would be kind of you, if you think hounds are coming towards you, to give the fox a chance to get across the road."

Why, if masters of hounds took this line, they would make no end of friends, and they would have no trouble whatever. Often the townsman motor cyclist, much as he may love the country and rural sports, does not know when he is erring, and only needs to be told kindly and tactfully to amend his ways. It is only when folk try and patronise the motor cyclist, or adopt the "Get off the earth" attitude, that he gets his back up and falls back upon his rights and privileges to use the road equally with the barefooted tramp or the occupant of a two-thousand guinea car.

THE BIJOU SIDECAR OUTFIT.

Lightweight Passenger Machines and their Development.

BEFORE the war it was regarded as cruelty to machinery to attach a sidecar to any motor cycle under 500 c.c. capacity, but so great has the development been in engine efficiency that there are now quite a large number of small sidecar outfits on the road giving excellent service now that framework and cycle details have been strengthened to meet the new demands.

Until recently the majority of these machines were two-strokes, but for 1922 quite a number of small four-strokes have been introduced having engines of 350 c.c. capacity, so that two and four-stroke sidecars of the bijou class are about equal.

Low-priced Sidecar Outfits.

The following list conveys some idea of the machines available for selection, from which it will be seen that it is now possible to secure a sidecar outfit for less than £70, while the majority are under £100.

Owing to their low initial cost and, what is more important, their extremely economical upkeep charges,

this type of machine promises to be very popular during the coming year. In our list we embody, in abbreviations, certain details of specification which indicate the excellent value offered.

B. H. Davies

MR. T. E. C. HIRST is one of those inventors who consider that the best use has not yet been made of the spring seat-pillar, though his compound springing is quite applicable to front forks and other insulating members. He employs three coiled springs, a piston, an oil chamber, and a valve. The main spring is at the bottom in the oil cylinder. As the load compresses this spring, the valve is opened, and oil passes up a groove in the valve stem. This oil raises the head of the valve, which in turn compresses the inner of the two springs at the top of the device; the outer of the two upper springs takes the rebound.

Hirst's seat-pillar. No. 159,349. 3/3/21.

turn compresses the inner of the two springs at the top of the device; the outer of the two upper springs takes the rebound.

A la Heath Robinson!

One occasionally hears of enthusiastic inventors who pawn their shirts in order to protect the great idea before holding a levy of the eager millionaires who desire to finance the patent. Let us hope that M. P. L. J. Manoury belongs to the minority who are under no such compulsion; otherwise, I fear me his property would remain at the Mont de Piete until the crack of doom. For some inscrutable reason, he is very anxious that the rear frame of a motor bicycle should be supported when the back wheel is off the ground. So he adds a tiny third wheel to trail behind, and prevent the rear wheel proper from dropping into

Manoury's supplementary wheel. No. 147,066. 24/3/21

potholes. But this extraordinary contrivance does not even fulfil the designer's ideal, for it entirely fails to cope with a bump over a hump in the road—in fact, the trailing wheel might even jerk the back wheel off the ground again after it had regained *terra firma*.

Variable Timing Gear.

Two things may safely be predicted with regard to the Snarry and Bullocks engine, if ever it comes into production. The first is that its sponsors will be on the *qui vive* for some really reliable lathe hands; the second is that the engine will not be cheap. A previous patent has indicated that the chief feature of this two-

Snarry's valve mechanism. No. 158,589. 17/2/21.

stroke engine is a transfer valve located in the piston head and operated by a long tappet mounted inside a tubular connecting rod and actuated by a cam on the crank pin. These complications do not satisfy our ardent innovators, who have now adorned their crank pin cam

by making its timing variable. The cam is driven by spur gears off the crankshaft. The shaft of the driving pinion lies inside the hollow crankshaft, and is made in two pieces with a telescopic joint. The outer part of this shaft is provided with trunnions working in spiral slots machined in the wall of the hollow crankshaft. Thus the

valve cam can be advanced or retarded in relation to the crank pin.

An "Advanced" Piston Design.

I should much like to hear Mr. R. H. Pearsall expound the piston which he has protected in conjunction with the B.S.A. people. A glance at the sketch will instantly reveal two of its merits. In the first place, the skirt follows current feminine fashions, and is mostly conspicuous by its absence, thereby reducing oil friction. In the second place, the gudgeon pin bush holders slip into very narrow bearings in the waist of the piston; these tiny bearings allow the holders to rock a trifle, and so align themselves on the gudgeon pin; if a piston is mechanically rigid, friction losses are quite likely to occur when heat wrenches gudgeon pin bushes out of truth. On the other hand, the design does not give much escape for the intense heat communicated by the explosions to the piston head. The top skirt is little more than a narrow rim. The riveted joint between crown and bobbin is not a good heat conductor; if the heat gets past that joint, it has to forage about for a sizeable piece of skirt through which it can dissipate itself into the

B.S.A. and Pearsall's piston No. 161,392. 14/4/21.

lubricating oil. On the other hand, the piston is like the Irishman's coat, consisting mostly of holes. Regular fountains of oil will be spraying about its interior when the engine is working; and one suspects that Mr Pearsall desires to get rid of excessive heat by injecting streams of oil into the "innards" of his piston, as contrasted with the older method of conveying the heat into a big skirt rubbing against a film of oil on the cylinder wall.

Recent Patents.—

Improved Lubrication Indicators.

Mr. S. L. Bailey has protected two new forms of oil indicator. The vertical type, which is illustrated below, has two special virtues. In the first place, the plunger rises when oil is passing through the connections at its base, and so pro-

Bailey's lubrication indicator. No. 160,365
24/3/21.

vides an infallible indicator by night as well as by day. Secondly, by rotating the plunger, a sleeve is turned so that the effective area of the oil passages is varied. The second sketch shows that the plunger may be combined with a sight feed chamber and drip feed if desired, though the necessity for two indicators is not clear.

Sidecar Flexibility at Will, and—

Messrs. Swan and Yeats are Australians; and I hate to seem unkind towards a country which provided the British Army with some of its very finest shock troops in the late war. But I cannot camouflage the fact that they are trying to add a new terror to sidecaring. They point out, with some justice, that the current, or rigid, type of sidecar outfit demands a little care on corners, and has to be strongly built if it is to resist the resultant side stresses. They propose to facilitate cornering and to reduce the stresses thereof by a patent chassis in which a control lever of the coffee-grinder pattern is used to tilt the bicycle in or out on bends.

Their sidecar chassis is attached to the bicycle frame at three points. The lower attachments, fore and aft, are pivoted. The third is shown, complete with control lever, in the accompanying sketch, and is self-explanatory. This connection, ordinarily known as the saddle-pillar attachment, is normally rigid, an angular hinge being locked by a worm and quadrant. But when the control lever is operated, a pair of bevel pinions rotate the above-mentioned worm, and so cause the quadrant portion of the locking device to swing through an arc, small or great. The angle between the two arms of the hinge is thereby varied, and forces the sidecar chassis and the motor cycle frame ruthlessly apart or lovingly towards each other, as the case may be.

Morton's sidecar chassis. No. 160,630. 24/3/21.

—Automatically.

It is so long since I drove a sidecar attached to a motor bicycle by "flexible" joints that I have almost forgotten what the experience felt like. To the best of my belief there were two main drawbacks. One was that my thigh was apt to be rather painfully nipped between the tank and the sidecar; the other was that much faster cornering became possible, and that the tyres used to be wrenched out of their rims. However, Messrs. Morton consider that we have by no means heard the last of flexible sidecar connections, and the sketch shows their plan for an arrangement by which the sidecar wheel and the sidecar body cant over in sympathy with the tilt of the bicycle in taking a corner.

Steel Liners in Aluminium Cylinders.

Messrs. Bohringer and Digby are interested in cylinders built up from two or more metals, and are anxious to avoid shrinking an aluminium cylinder jacket on to a steel or cast iron liner. They are also afraid that the difference in the respective expansions of such metals under heat may create stresses in the liner, and perhaps spoil the gastight joint of the detachable head. Consequently, their steel liner is held down by the bolts which secure the detachable head to the

Bohringer's steel-lined cylinder. No. 160,575 24/3/21.

Another Spring Fork.

Mr. G. F. Shimmin, of 6, Lawson Street, Maryport, is anxious to find a manufacturer to take up his patent spring fork, a sample of which he has been testing for some time. As the sketch implies, the fork is on quite original lines, and, though the patent was accepted in 1913,

Shimmin's spring fork. No. 1,225
11/12/13

I publish it because Mr. Shimmin is an ex-Service man. The front wheel spindle and the fork ends are coupled by short links or levers. These links are connected to a pair of compression rods. Another pair of compression rods are hinged to the top of the rigid fork. Both pairs of compression rods join at a cross-head. The cross-head works on a guide between springs. The fork may be described as a hybrid between the original Triumph and Quadrant patterns.

5-6 h.p. Flat Twin and
Sidecar de Luxe, £172.

2½ h.p. Solo, £68.

5-6 h.p. Flat Twin, £130.

It is when you come to Winter Riding

that you really test your machine. Then the Reliability of the Raleigh proves itself. Steadily through storm and stress it makes its way, regardless of road or weather, giving always that silent service and consistent comfort which you want.

The 2½ h.p. at £68 and the 5-6 h.p. flat twin at £130 give unequalled value and when the glorious days of summer come again you will find your Raleigh giving you the same steady service—the machine that, with Dunlop tyres and Sturmey-Archer countershaft gear, always “gets there.”

LUCAS

Nº 60

"MOTOR-CYCLORN"

IMITATED
BUT
INIMITABLE

When selecting a Horn, the tone should be tested for penetrative power under the actual conditions in which it has to be used, viz., *on the road*.

Our MOTOR-CYCLORN No. 60 is a patented and registered model with the 'turns' of the tube enclosed in the body of the Horn, making it easy to clean. It is the result of many years' experience in Horn manufacture, and is strongly recommended for power of tone and durability.

Fitted with our patented canvas reinforced Bulb which is far more durable than the usual kind.

SUPERLATIVE ELEVATIONS.

Sir,—Your correspondent the Rev. C. D. Fothergill says that "England can boast the highest road, hotel, and agricultural land in Great Britain." He is right in the second matter, though he does not name the highest, which is the Tan Hill Inn in Yorkshire 1,727ft. He may be right about the cultivated dirt which is nearest heaven, but that is uninteresting.

We are all interested however, in the highest British road, and therein he is wrong, for the Roman "road" above Haweswater is only a poor track, even if "paved in parts"; so is the Roman road over Blackstone Edge, near Littleborough.

I believe the highest English road to be the Killhope or Nenthead Pass, between Weardale and Alston, 2,056ft. The Cairnwell Pass in Scotland (Devil's Elbow) is 2,200ft. Messrs. Bartholomew, in their touring atlas of the British Isles, give the road from Braemar to Loch Builg as 2,500ft., but I believe this is much overstated. Their own half-inch map shows it as more like 2,200ft. There is a "road" of sorts from Ballater over to Glen Clova, which, according to Gall and Inglis, reaches 2,275ft.

After all, what is a road? Has any Scots rider of the Scott passed from Glen Muick to Glen Clova?

FITZWATER WRAY.

SIDECAR FUEL CONSUMPTION RECORDS.

Sir,—In reply to Mr. H. S. B. Booth's and Mr. Tom Hammond's letters, which appeared in your Show and following numbers respectively, I herewith supply the following details as requested.

My machine is a late 1920 chain-cum-belt Triumph, standard in every respect. I found my 32 jet was too small to give good running, so this I slightly enlarged, which I believe is not a step towards fuel economy. I keep my tappets adjusted so as to leave just sufficient space to force a visiting card between them. Have no air or oil leakages, and drive with ignition and air fully advanced (except, of course, up hills), and can get a speed of 40 m.p.h. by speedometer with a 10 st. passenger, which I think is quite the average. My sidecar is a touring model—Paragon make, fitted with a Matchless windscreen.

I may say I weigh 14 st. and my passengers 9 and 9½ st. respectively. Pratt's petrol and Vacuum B.B. oil were used—one pumpful every five miles. I can only think Mr. H. S. B. Booth's and friends' smaller consumption is due to their method of driving.

I am, on these matters, as I sign myself, an
Ealing Common, W.5.

IGNORAMUS.

Sir,—I have read with interest Mr. Tom Hammond's letter, and I can confirm a consumption of 92 m.p.g. with sidecar.

I bought a 1913 Triumph, Binks carburetter, N.S.U. two-speed, C.B. Triumph sidecar second-hand in May this year, with the intention of a trip up North for my holidays in June.

I left Watford on May 29th at 6.25 a.m., with empty sidecar (except for light suit case) and spare can of petrol, and arrived at Nottingham at 1 p.m. Left Nottingham at 4.30 p.m. with passenger and luggage, and arrived at Pontefract at 8 p.m., where I put up for the night. On the Monday we left Pontefract at 9 a.m. and passed through Wetherby to Richmond, and found on reaching there I had lost my sectional map to Kirkby Stephen.

On asking a motorist at Richmond the best way to Kirkby Stephen, the er-er-misguided man gave us directions which

lay over the notorious Buttertubs Pass; but the machine took us through Reeth, and, except for one or two of the worst parts where gates ran across the road and boulders lay in the track half-way up steep hills, the fine engine pushed the machine up, and, assisted by language which blessed the person who gave us this route, we managed to get to the top all right, and had a delightful run down into Kirkby Stephen, where we had a short rest, and then pushed on to our destination, Orton, through a heavy rain storm, which caused us to miss a turning and go round by Ravensdale, and we finally arrived at Orton about 6 p.m. My only troubles were one belt and one fastener breaking.

Leaving Orton, June 5th, 9 a.m., I went north to Appleby, and through Brough, Bowes, and Scots Corner, and down to Nottingham, with only three stops for punctures, arriving Nottingham at 7 p.m., where I dropped my passenger. Left Nottingham next day at 10 a.m., and arrived at Watford at 2.30, including one stop.

I averaged, with a careful record of consumption, slightly over 86 m.p.g., and had no mechanical trouble whatever with the machine.

YOUNG FORWARD.

Watford.

Sir,—Triumph outfits are not expensive to run, if my experience is worth anything. I have a 1921 all-chain model with heavy Gloria sidecar.

My wife and I weigh about 22 stone, and, with 50 lb. of luggage, the very first journey taken after the arrival of the machine from the works—a two hundred mile run—worked out at 72 m.p.g. Later this was materially improved; without luggage, in Cheshire, we have done as well as 107 m.p.g., and regularly do 80 to 90.

NC 301.

Manchester.

Sir,—Referring to "Mahlib," I should like to give my mileage to the gallon. I also own a 1917 Triumph sidecar outfit, and find that I can get from 120 to 140 m.p.g. in rather a hilly district. My passenger and myself are just over 23 st. together, and always carry the usual spares. I also wish to add that I have never experimented with economy stunts. I use a 1921 B. and B. carburetter, pilot jet, and can safely say I can leave any outfit on a freak hill. I can do 64 m.p.h. any time (Stewart speedometer). I would not part with my trusty Triumph for a Rolls-Royce, even if given to me.

TOP-HOLE.

Trimdon.

Sir,—I have been interested in the discussion referring to the petrol consumption of the Triumph and sidecar.

I own a 4 h.p. Triumph fitted with a Watsonian sidecar and an Easting windscreens. I regularly obtain a petrol consumption of 75 m.p.g. without any deviation from standard, and carrying a total weight of twenty stone.

I recently obtained 90 m.p.g. simply by fitting a smaller jet. It is as well to add that one has to be content with appreciably less power, and personally I was pleased to revert to the standard setting.

TURNIPS.

Duffield.

Sir,—"Ignoramus's" 92 m.p.g. on a Triumph and sidecar (two up) is certainly "going some" in economical running. I own a W.D. Triumph, chain-cum-belt, 1918 engine, and riding since Whitsun over roads in various parts of the country (Wales, Derbyshire, and Yorkshire Moors included), I find I have averaged 65 m.p.g. At first I only got about 50 m.p.g., but for some reason or other it suddenly improved to 65 m.p.g., and stayed at that for months. On my last few

rides it has gone up to over 70 m.p.g., and on one trip to Brighton and back a fortnight ago it was 84 m.p.g., but that, I think, is due to a gadget I fixed up to use more air. I always buy B.P.No. 1 and Castrol C.W. oil.

An A.A. scout in Berkshire, who runs round on one of the repair outfit machines, told me he averaged 68 m.p.g. all the year through, and he humps a very hefty load around.

J. F. C. ANSELL.

Sir,—I have an Ariel No. 1 sidecar fitted to my 1921 Triumph, and on a recent visit to the East Coast, carrying one passenger, I had no difficulty in covering from 95 to 100 m.p.g.

Birmingham.

AN IDEAL SPRING FRAME—FROM THE INVENTORS' VIEWPOINT.

Sir,—I have read quite a lot of correspondence lately concerning spring frames, in which everybody seems to be looking for an ideal.

What is this "ideal"? Is it such a frame as will allow the rider to delude himself into the idea that his 'bus has taken unto itself wings, and is floating along about a couple of inches off the road, or will the best that can be done with the material at our command, such as springs that will persist in oscillating a little, etc., suit the seeker?

I have a design for a spring frame (who has not who thinks about it at all?), which I can confidently state fulfils all the requirements I have seen mooted up to the present.

It does not let the back wheel wobble.

It does not interfere with lateral stability (sounds like an aeroplane).

It does not tighten or slacken the driving chain or belt, as the case may be.

It does not let the middle of the bicycle float on without a bump, while the front and back wheels alternately drop in a pot-hole about six inches deep, and there is a lot of other things it does not do; still, it is a spring frame, which at least is unique in the respect that there is no alteration in the tension of the final drive.

No, Mr. Editor, it is no use asking to see it. It is still in that portion of my anatomy I call my brain (some people, I know, are not so polite), and it is going to stop there until someone gets interested, and, incidentally, interesting.

Birmingham.

SPRING FRAME.

MISLEADING HORSE POWER RATINGS.

Sir,—The writer of "Misleading h.p. Ratings" states that the 996 c.c. Matchless is exactly the same as the 10 h.p. engine which is supplied for cycle cars. In this he is very considerably mistaken. The 1,000 c.c. engine has a bore and stroke of 82×94 mm. respectively, and the 10 h.p. or 1,100 c.c. engine has a bore and stroke of 82×103.5 mm.

THE M.A.G. ENGINE CO., LTD.

OSBORNE DE LISSA, Managing Director.

[This amendment does not alter the point of the article; an increase of approximately 100 c.c. does not justify a variation of 3 h.p. in nominal rating.—ED.]

Sir,—Reading your article, I was much interested to see the many ideas suggested for deciding the power. As the person who has most concern about the motor cycle he is going to buy is the one whom the rating affects most, why cannot manufacturers give their power as "capacity—brake horse-power all out"—ratio? The racing Norton would then be 500-25. Many people wishing to buy a light touring machine would rule out the 250 c.c. J.A.P.-engined machines as being too low, and buy a 2½ h.p. machine (350 c.c.) simply on the strength of increased capacity, though the 250 c.c. engine, being capable of revving at 10,000 r.p.m. is undoubtedly more powerful than many 2½ h.p. machines.

Warrington.

CARROTS.

SUNDAY COMPETITIONS.

Sir,—I really fail to see "EF 1508's" ideas on Sunday competitions. May I point out to him that not all men care to watch hill-climbs? Still fewer would prefer watching them on a Sunday afternoon to taking the opportunity of a sleep. Also, though "EF 1508" does not mention them, there are the women to consider. Sunday afternoon is to them a rest period, and the continual bursts of open exhaust sprints are, to say the least, not conducive to sleep.

Also, may I ask your correspondent what he means by asking whether the "man in the street" stays at home to earn the wherewithal to exist? Not many men work on Sundays.

IDDY UMPY IDDY.

Warrington.

Sir,—Allow me to thank you for your continual stand against Sunday competitions. Being a motor cyclist and also a worker among the young, I appreciate your great help very much.

S. H. HILL.

HEAD LAMP DIMMING ETIQUETTE.

Sir,—Readers of *The Motor Cycle*, who are troubled by the blinding glare of motor car head lights when riding at night, may be interested to learn how the problem is being met in the U.S.A. The sudden dimming of a car's powerful head lights may be as confusing to the driver of a car as the previous glare was to the approaching motor cyclist.

A new head light lens has been placed on the American market during the present year, which fulfils the legal requirements of every State having head light laws, and is already supplied as standard on several of the best makes of American cars.

Approved American anti-dazzle lamp referred to by Mr. E. W. Troughton in the accompanying letter.

This lens, which is made to fit any make of head lamp, optically directs the light rays, giving, without loss of light, wide dispersion and no glare. Glare is avoided by keeping the powerful light rays below eye level. This lens gives a beam 50ft. wide at a distance of 100ft. from the lamp, and renders objects plainly visible at a distance of 500ft. When viewed from in front, from above the level of the lamp, the light appears quite dim.

I recently read that our Inter-departmental Lights on Vehicles Committee has decided that "it is not possible to eliminate dazzle (in motor car head lamps) and at the same time leave an adequate driving light." It evidently has not heard what the Americans are doing to cope with this matter.

I enclose sketches showing how the American lenses achieve their good results. It will obviously be cheaper, for motorists having dazzling head lights, to fit new lenses in their lamps than to buy new anti-dazzle lamps, such as those patented by Sir H. Grubb and Sons, Ltd., or the dipping head lamps fitted on the Prince of Wales's 1922 Rolls-Royce.

I ride solely for pleasure, and have no connection with the motoring trade.

ERNEST WM. TROUGHTON.

REVIVING AUTOMATIC VALVES.

Sir,—I read with great interest the letters of both Mr. J. E. Smith and "Reactionary" concerning automatic inlet valves. I am interested, inasmuch as I have ridden quite a number of machines having engines on the a.i.v. principle, and am a satisfied user of such.

My argument is: Given an engine (say present-day Sunbeam design), but fitted with an a.i.v. instead of m.i.v., the result of the running would be astounding. To my mind, it was not the a.i.v. that was responsible for many failures, but the poor designs of the engines.

Inadequate cooling properties seemed to be a great setback with most of the early motor cycle engines, as I experienced with one of my own (a 3 h.p. Cunard). This was due to the bad design of the top of the crank case, which was responsible for under-oiling; but after drilling a number of holes in this particular part to enable the oil to splash effectively to the cylinder wall, I experienced no further trouble in that direction, and I have yet to encounter

an engine of the same capacity to surmount hills better with a passenger.

Moreover, I consider the carburation and ignition ideas of the a.i.v. period were responsible for the poor running of engines, and I maintain that, given an up-to-date engine fitted with an early carburettor and magneto, the result would indeed be poor.

To further my argument, I advise any mechanic to strip a 2 h.p. four-stroke M.A.G. engine of its inlet valve mechanical gear, and thus convert into a simple a.i.v. by fitting a suitable spring and plugging the crown of the induction pipe. The result will be found to be identical with its former running, and this proves to me that the power derived from this remarkable little engine is not altogether due to its m.o.i.v., but to the general modern construction, and the fact of its inlet valve being of such a liberal diameter.

H. LE FE.

FUEL ECONOMY ON A TWO-STROKE.

Sir,—I have frequently noticed that readers of your journal complain of the low petrol consumption of the 2½ h.p. two-stroke Villiers engine.

Perhaps some items relative to the performance of a similar engine fitted to my two-speed O.K. might be of interest. It is fitted with the standard Amac two-stroke carburettor, jet No. 24, and my average m.p.g. is about 140, and as much as 160 m.p.g. has been attained on flat roads, no special tuning being done.

The reason for these high figures is partly due to the fact that I fitted a long exhaust pipe to the existing small tail pipe. This pipe is fitted with air

Three vents (as above) were fitted by Mr. R. B. Porter in the exhaust pipe of his Villiers-engined lightweight, with encouraging results.

vents, as shown, such that when the machine is in motion a partial vacuum is continually set up in the pipe; thus the exhaust gases not only leave the cylinder by "expansion," as is usually the case, but flow rapidly into the exhaust pipe containing gases at a much lower pressure. A portion of the existing pipe was bent down slightly to prevent sound escaping. Each vent was riveted to the pipe by ½ in. copper rivets, three vents being used in all.

I might add that the above was not fitted to the engine because the fuel consumption was poor, but rather to endeavour to increase the already moderate consumption, which was about 110 m.p.g. RAYMOND B. PORTER.

SIDECAR OR CYCLE CAR—CONTRASTING VIEWS.

Sir,—Last summer I intended buying some sort of a motor conveyance, but could not afford anything beyond £300. I haunted Great Portland Street and its environments and saw many two-seaters, but as I am a family man with two boys, I wanted something that would drag us all about with a fair amount of luggage. The cost of upkeep also had to be largely considered. With the majority of low-priced two-seaters, I could not see how I could fit four people with luggage, but with a high-powered sidecar I could arrange for one boy (aged five) with his mother in the sidecar, and the other (aged ten) on the Tan-Sad, and the luggage grid would get over the baggage problem. I eventually decided on an A.J.S. sidecar outfit, and I have never regretted my choice. We all fit up beautifully, and I have yet to meet the hill which it does not take smiling. I have no connection with the A.J.S. firm.

JOHN T. DAVIES.

Sir,—“Family Man’s” statements recently recall to me the days when I ran a motor cycle and sidecar, and believed that I was getting my motoring at the most advantageous cost. My experiences with three different makes of sidecar outfits used over some four and a half years were good enough to make me feel as this correspondent does. I have since found that my running costs are only slightly increased during the last two years, and that using a 1920 type G.N. This car is lighter on tyres than was any one of my motor

cycle and sidecar mounts, it garages in the same shed into which my previous machines used to run, and, as for repairs, beyond plugs and minor adjustments none have become necessary. I think the extra protection from weather and general comfort, together with the ability to arrive at one’s destination clean, justify the increased cost of taxation, while the insurance must be proportionately the same.

D. H. VIVIAN.

TAXATION AND THE SERVICE MAN.

Sir,—I quite agree with “Corporal” as regards paying full taxation, and I am sure, if it were not for this, there would be many more of H.M. Forces enjoying the finest pastime in the world.

I do not agree with “Carrots’s” letter at all. A keen motor cyclist is really never happy on a hired bus.

Regent’s Park, N.W.1.

LIFE GUARD.

72 M.P.H. ON A PRE-WAR SINGLE.

Sir,—My pre-war fixed gear Triumph (with W.S.R. jet tuned to the right point) always goes much faster when a nice breeze is blowing directly against the valves. The harder this side breeze the faster the pace, and one evening, on a splendid but not quite level road (very slightly uphill), I covered the distance between two milestones in fifty seconds, after warming up and oiling nicely, with one of the afore-said breezes cooling the valves. Is this a well-known phenomenon?

OLD ‘UN.

Reading.

[Has our correspondent tried measuring the distance between the milestones as a means of explaining the phenomenon?

At the same time a side breeze would undoubtedly assist in cooling the valve ports.—Ed.]

WHAT APPEALED TO A LADY.

Sir,—I read with much interest your excellent reports of the Motor Show. In a later issue you have an interesting contribution concerning the machines which are considered specially suitable for women’s use. I was rather surprised to notice that the little Xtra car was not mentioned. I spent a considerable time at the Show myself, and I certainly think the Xtra was quite the most attractive general-purpose machine for our sex. I know that some of us like to have fast machines, but the great majority prefer to keep clean and indulge in no excessive speeds. The Xtra impressed me very much on account of its exceptional protection of the driver. I had a trial run, and was surprised to find how very suitable the machine was, and that it was next to impossible to make it skid, even on the greasy roads which were prevalent during the Show.

As a matter of fact I was much surprised at its speed, and one would hardly believe that it could go along as well as it does with such a small engine.

I should add that I have no interest whatever in the Xtra, except that I hope to own one shortly.

A CHRISTMAS DREAM.

Almost Every Motor Cyclist has his Own Ideas about the Perfect Motor Cycle, but it is not Everyone who Realises, like our Correspondent, that there is apt to be a Fly in the Ointment.

FOLLOWING the example of all good motor cyclists, I decided that my Christmas journey should be accomplished by road. Accordingly, the wife and family were duly packed into my 1910 single-gear sidecar outfit, and we set forth with brown paper parcels bulging from every crack. The less said about that journey the better. Suffice it that the heavily loaded sidecar was beyond the unaided efforts of my trusty "3½," and that, though we arrived at our destination late on Christmas Eve, my frame of mind was not exactly compatible with the seasonal festivities.

On the following day, having survived the usual formalities and rejoicings, I retired to a dark and incredibly draughty shed, and attempted to disgruntle the "innards" of my ancient and badly-treated engine, in the hopes of finding the extra power required for the return journey.

Working in semi-darkness, I marvelled at the ingenuity of pre-war manufacturers in placing nuts where nothing but universally jointed and case-hardened fingers could possibly remove them. Visions of the ideal machine floated before my eyes. What a "bus it would be! Why did not manufacturers consult their clients?

An air of oil and profanity.

After hours of labour things came apart suddenly, and at this critical juncture there entered the air of oil and profanity—my wife. Calmly she informed me that it was time to clean up for Christmas dinner. My expression said more than any words in our sadly incomplete vocabulary could ever infer, and she left hurriedly. Nevertheless, civility demanded that I should leave the ruins to the tender mercies of rats and chickens, and, hoping for the best, I returned to the house to repair my damaged knuckles and generally make myself presentable.

That Christmas dinner was a success, and, mollified by the good fare, a comfort-

A DREAM MACHINE.

The clean sweep of the sheet steel side members is here broken away to show the flat twin engine and gear unit and shaft drive.

cycles were without parallel. In a few moments I dashed off a sketch of my ideal. The machine had a flat twin Bradshaw type engine enclosed between two sheet steel side members, with only the cowled cylinder heads protruding from the clean sweep of its polished sides. A three-speed gear was incorporated, while the engine and final transmission was by shaft and bevel.

The job was perfect.

The driver sat in a comfortable armchair, and was protected by legshields, footboards, and mudguards of ample width. Tools were carried in convenient and rattleproof drawers under the footboards. Grease cups replaced oil holes, and, in short, the job was perfect.

With an air of conscious superiority I handed the sketch to the envoy, remarking in a lofty voice, "What about it?" There ensued a tense silence, followed by a string of questions. "How do you propose to attach a sidecar?" "How do you get at the carburetter?" "What happens when the magneto contact breaker sticks?" "Where are the controls?" "How do you get at anything?" "And how do you propose to make it?" Somewhat nettled by these questions, which seemed to me to cast doubts on my ability, I replied, rather testily I am afraid, "These

"By merely undoing one wing nut, every part becomes immediately accessible."

In answering these advertisements it is desirable to mention "The Motor Cycle."

A Christmas Dream—

matters are details, and besides, my dear fellow, you do not seem to realise that by merely undoing one wing nut every part becomes immediately accessible."

"Where is the wing nut?"

"That," said I, "is a secret which I shall reveal when the first batch of machines is nearing production." The envoy retired grumbling, and I resigned myself to dreams of a perfect mount, to be delivered in the early spring, free of charge, of course. Fame would come my way, and the "Ubique" motor cycle would be hailed as one of the world's greatest engineering feats. Money would pour in, but I would remain faithful to the motor cycle, and would scorn Rolls-Royces—what advantages had they over my wonderful invention, anyway? There was just one

thorn amongst the rose leaves, but in my blissful state it troubled me but little—where *was* that wing nut?

* * * * *

"It's nearly twelve o'clock, dear, and you must get up early to-morrow and clean up that mess in the stable before we start."

"Where is tha—? Wha-a-t—? Oh!—"

* * * * *

I never found the correct place for that wing nut. Perhaps, after all, there was something in the insinuations of the envoy. It is just possible, indeed, that motor cycle design is best left in the hands of those whom it concerns, while the enthusiastic amateur contents himself with spoiling the manufacturers' creations. **UBIQUE.**

THE F.I.C.M.

Some Notes on its Purpose and its International Competition Rules.

ALTHOUGH not very well known to the average motor cyclist, the F.I.C.M. is an organisation which does a good deal of important work. The initials stand for the French form of the International Federation of Motor Cycle Clubs—a body composed of representatives of all the principal motor cycle clubs in the various countries, whose delegates meet together about twice a year to discuss matters appertaining to motor cycles throughout the world. Though an international organisation, the F.I.C.M. is run very largely on British lines, and has taken the rules governing British motor cycle competitions as its model. Its great work has been to compel the running of all international competitions under the same rules (rules which were recently drawn up), to enquire into and pass international records, and generally to look after the interests of motor cycling internationally.

Before it was in proper working order, a British rider might take part in a competition on the Continent being absolutely ignorant of the regulations, and suffer injustices against which he would have no redress. Such a contingency is now impossible, and an English rider who has competed in the English Six Days and the T.T. can safely compete in any race or reliability trial of an international character in any one of the countries belonging to the Federation, and know for certain that his machine would have to conform to the same conditions as those drawn up for the English classic events referred to above.

Each country now recognises the others' competitors' licences, and if a British rider has his licence suspended for any malpractice he would not be able to compete in France or any other country belonging to the Federation. The same remarks apply to an Italian rider who had transgressed and attempted to enter, say, the T.T. race.

An Annual Register.

Full information is contained in the annual register of the F.I.C.M., which can be obtained from its secretary, Mr. T. W. Loughborough, 83, Pall Mall, London, S.W.1. This booklet gives the names of the various clubs forming the Federation, their secretaries; an introduction telling the reader what the F.I.C.M. is and what it does, a list of rules of the Federation and international competition rules, while it tabulates all world's motor cycle records, which, of course, are revised each year.

The last great meeting of the F.I.C.M. was at Milan, and was briefly referred to in last week's issue of *The Motor Cycle*. It lasted two days, and the same enthusiasm was shown by the delegates and the same good work carried out as has been done since the revival of the F.I.C.M. in 1912.

One interesting matter brought up at the conference was the question of Spain, where the governing of the sport is in a somewhat chaotic condition. Nominally the ruling body is the Royal Spanish Motor Cycling Club, which, like the A.C.U. of England, is closely associated with the Royal Spanish A.C., but it was clearly pointed out at the meeting that this body did not actually control the sport, but the real active club was the Catalonia Motor Cycle Club, of

Barcelona, which is not recognised by the Spanish R.A.C., with the result that the Spanish delegates were told that they should endeavour to form a body truly representative of Spanish motor cyclists.

The International Trophy.

Another piece of good work was the drawing up of a proper set of regulations governing the International Trophy, presented by the British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., for the annual International Six Days Reliability Trial. These regulations merely deal with the conditions of the trophy, but it is left to the organising body of the actual competition to draw up its own rules in detail, which, of course, conform to the F.I.C.M. competition rules.

The American records quoted in last week's issue still await confirmation, pending certain information from America; and, dealing with the matter of records, it is interesting to be able to mention that Della Ferrera's flying kilometre in 25.9s., 138.99 k.p.h. (86.37 m.p.h.) in Class C (500 c.c.), ties with that of Judd (Norton) in speed, and this was allowed by the Federation to rank as an international record, the first held by Italy.

Timekeeping.

Another interesting decision was to establish an international panel of timekeepers, so as to place the timekeeping of all international events upon a satisfactory basis, and this will mean the upraising of timekeeping on the Continent to the same excellent standard which has been attained in this country, and Mr. A. V. Ebbelwhite (England) and M. Georges Longuemare (France) were instructed to serve on a special sub-committee to go into the question in detail.

When claims for international records are made, metrical distances as well as miles and yards must be claimed.

It was also agreed that a request be sent to the automobile clubs in each country represented on the Federation that, in the event of any dispute or difference arising in connection with the sport or pastime of motor cycling, the automobile clubs should recognise the F.I.C.M. as the international body authorised finally to adjudicate in any such matter.

Each club's subscription for the International Federation of Motor Cycle Clubs has now been fixed definitely at £6 sterling, while entry fees for international competitions will now be reckoned in pre-war rates of exchange; consequently, as an example, a British entry for the International Six Days Trial in Switzerland will be based on the rate of 25 fr. to the £ instead of 21 fr. to the £1.

In the course of the conference, the question of admitting ex-enemy countries into the Federation was discussed, and those present were reminded of the decision of the first F.I.C.M. meeting after the war, held in London, to the effect that those countries could only be admitted into the Federation when they were received into the League of Nations.

The meeting was attended for the first time by the Chairman of the A.C.U. (Col. F. S. Brereton), who was very much impressed by the work carried out by the F.I.C.M., and foretold a great future for it.

Number plates to be illuminated thirty minutes earlier, vide Road Vehicles Registration and Licensing Order (1921).

Reminder.

Have you renewed your motor cycle licence yet?

In America.

Mr. W. H. Wells, the London manager for the Hendee Manufacturing Co., is in America on his annual visit to the Indian works.

From Overseas.

As usual, we are in receipt of a number of letters containing greetings from overseas readers who well timed the departure of their missives to reach the office at Christmas time.

In 1922.

To all riders: May your m.p.g. improve, may your m.p.h. be lawful or unobserved, may your competitive efforts be successful, and may punctures and other troubles be nil.

An Opportune Time.

This time of the year provides favourable opportunity thoroughly to overhaul the machine. Those who can ill spare their mount for this purpose should "go over" their cycle bearings, cleaning and well packing them with grease.

The London-Exeter Trial.

This year's London-Exeter Trial produced a record entry, no fewer than two hundred owners of motor cycles and three-wheelers entering for the popular Boxing Night event. Last year there were 173 entries in the two and three-wheel classes. In next week's issue of *The Motor Cycle* we shall give a number of impressions written by competitors.

An Edinburgh Race Track?

Quite a stir has been caused among Edinburgh enthusiasts by a proposal which was made at a meeting of the local association, the Edinburgh and District Motor Club. In the course of a discussion regarding the erection of an exhibition hall suitable for the Scottish Motor Show, the hope was expressed that, besides a "Show" hall, they might have a sports ground, where they would be able to have a track for motor cycle racing. The project has been received in motor cycling circles with great enthusiasm. The successful way in which the Edinburgh Motor Club organises its various trials signifies that it is wholly capable of undertaking the responsibility of a racing track, and there is no fear of want of support. It has long been a decided blank in the Scottish motor cyclist's existence; and, now the proposal has been made, it will in all probability be carried forward to successful completion.

The T.T. Dates.

We have tested the opinions of manufacturers and riders regarding the T.T. dates, and without exception all are in agreement with us; the dates are most unsuitable. Some of these opinions appear on pages 891-2.

Old Engines Never Die!

Inspired by the recent paragraph describing how a reader used a motor cycle engine to drive a circular saw, a correspondent, who runs a small cabinet-making business, informs us that an old 3½ h.p. Humber engine drives for him:

- A circular saw,
- A moulding machine,
- A boring machine,
- A planing machine (with an eight-inch cutter), and
- A grindstone.

But not all at once, we should imagine!

Mr. Einar Host, secretary of the Danish Motor Cycle Club, which recently held a conference of all Scandinavian clubs at Næstved. Mr. Host, who is considered to be one of the best riders in Denmark, rides an Invicta, which carries the records of its success on its front mudguard.

Special Features.

THE CHEAPEST FORM OF TOURING
A FOUR VALVE "SINGLE" UNDER TEST.
CARRYING THE SPARE WHEEL.

Longer Days Ahead.

Christmas over, longer days lie ahead, and motor cyclists begin to think of their next new mount.

Petty Offences.

Several readers report police activity with regard to such items as illumination of number-plates and the necessity for two independent brakes.

A New A.J.S. Competitions Manager.

H. R. Davies having joined the Hutchinson Tyre Co., F. W. Giles (well known as a successful competition rider) is now the A.J.S. competitions manager.

To Visit the Antipodes.

Mr. George Stevens, of the A.J.S. firm, sails for the Antipodes on Friday of next week. The object of his trip, which will include a visit to South Africa, is to study overseas conditions. Mr. Stevens has not enjoyed the best of health for some time past, and it is hoped that the long sea voyages will prove beneficial in this respect.

Programme of "The Motor Cycle" Film.

To-night the film will be shown after the dinner of the Truro and District M.C. and L.C.C., which takes place at the Women's Institute at 7.30 p.m.; to-morrow it will be included in the programme of the Polytechnic Hall, Falmouth, on behalf of the local motor cycle club. For New Year's Day the Barrow and District M.C. has staged a special exhibition for members and friends in the Walney Theatre, Barrow. On Wednesday it goes down to Neath, and on Thursday to Cardiff, where the local clubs are arranging for its exhibition.

Saving the Crops—by Sidecar.

Five hundred and ten acres of potatoes, owned by a Washington state rancher, says the *Scientific American*, were in danger of destruction by the potato bug. The little pests were working so fast that it did not seem as though any means of extermination could possibly keep up with them, let alone catch up with them. But the rancher was a resourceful soul, and he attached an insecticide-spraying outfit to the sidecar chassis of his motor cycle, utilising the power of the machine for traction and for spraying. With this outfit he found it possible to spray one hundred and ninety acres per day with Paris green, whereas a horse-drawn sprayer would by no expedient have been able to get above thirty-five acres. With the exceedingly hot, dry weather that was so general during the past summer, a day's delay might well have spelled ruin for the crop, but the motor cycle saved the situation.

THE T.T. DATES.

Opinions of Riders and Manufacturers agree with that of "The Motor Cycle" as to the Unsuitability of the Week preceding the Whitsuntide Holidays.

IN last week's issue of *The Motor Cycle*, we drew attention to the unsuitability of the T.T. dates, which are in the week preceding the Whitsuntide holidays, and therefore an inconvenient time for manufacturers, who are always busiest just before any spring holiday than at any other period of the year.

Three Alternatives.

We pointed out that an alternative date might be found by considering the following three suggestions:

(1.) To fix the date of the motor cycle races a little earlier.

(2.) To postpone the races a fortnight by arrangement with the parent body—the R.A.C.—whose car races are at present arranged to take place on June 20th and 22nd.

(3.) To hold the races in September after the M.A.C. Highway Board has had time to repair the roads following the car races.

Quite a large number of riders and manufacturers have written us on this matter, and almost without exception agreement with our views is expressed.

Below we give a selection of these opinions from those whom the matter directly concerns:

MR. W. J. HASSALL, director of Norton Motors, Ltd., points out that their staff which would be in the Isle of Man is quite distinct from those engaged on production, but he adds:

"We should certainly like to have seen the date fixed later. . . . It is very unfortunate that the London-Edinburgh Trial will clash with the finish of the Senior race, and if it was absolutely impossible to get a later date for the I.O.M. races, we would suggest that the London-Edinburgh run be held a week or so later. . . . We trust something will be done in the matter."

MR. WILLIAM PARKES, of the Sun Cycle and Fittings Co., Ltd., suggests that the British Cycle and Motor Cycle Manufacturers Union will have to consider the matter. He says:

"I take it that the motor cycle section of the Union will consider this date, and it will depend upon them as to whether the Junior T.T. race is held on the date fixed. It seems to me that the A.C.U. do some very funny things, and take up the attitude that the manufacturer has no consideration in these matters. The A.C.U. should have seen the Manufacturers' Union first, to ascertain whether this would fit in with the demands of the industry. I shall bring this up at the first opportunity, as it is a most important matter."

Sacrifice of Home Trade.

MR. A. H. HADEN, manufacturer of New Comet motor cycles, writes:

"I am pleased to hear you have taken up the matter of the T.T. dates for 1922, as it means, both to manufacturers and agents, a cutting of their interest in the races or the sacrifice of the two best weeks of the home trade."

VIVIAN OLSSON, the well-known amateur T.T. and competition rider, deplores, but is resigned to, the dates selected:

"Seeing that the A.C.U. were foolish enough to allow the R.A.C. to annex the best date, I cannot see there is anything else to be done but hold the T.T. at the end of May. T.T. riders who wish to take part in the great M.C.C. run to Edinburgh will just have time to do so."

Another well-known rider, CAPT. J. A. WATSON-BOURNE, agrees with our views that the dates might be more suitable owing to the proximity of the holiday. He writes:

"It is a mistake to allow the races and the Edinburgh run to clash, from the point of view of public interest and entry lists of the latter. Personally, I should be very sorry to miss the run, as, when held *before* the races, it is excellent training for sitting in the saddle for long periods if one has not been doing any lengthy rides during the spring."

VELOCE, LTD., write:

"We agree with you that the dates, May 30th and June 1st, are not convenient, as they precede the holiday, and this is the busiest time of the year. We would prefer it later, so that there would be less likelihood of the roads being in bad condition for practice, etc.—say in July."

The manufacturers of the Levis motor cycle also agree with our view in a letter from which the following is an extract:

"We are quite in agreement with you regarding the T.T. dates, as they are very unsuitable. It will be a most awkward time for manufacturers to arrange to have a large percentage of their staff away in the Island, and we think for this reason alone an effort should be made to get the date altered. You are also quite right in your suggestion regarding the London-Edinburgh run, and there is no doubt whatever that the T.T. races will entirely overshadow this otherwise important event if the suggested dates are adhered to."

Middle of June Suggested.

The following is the opinion of MR. NORMAN DOWNS, of New Imperial Cycles, Ltd., the winners of *The Motor Cycle Cup* in last year's races:

"I think that the trade is indebted to you in pointing out the date when the T.T. race comes. . . . The proposed date of the race being in the week preceding Whitsuntide week is a very serious handicap, and I think that every endeavour should be made to have this date altered. The most suitable dates, it appears to me, would be June 13th for the Junior and June 15th for the Senior."

MR. GEORGE GRINTON, a well-known Scottish rider, considers the T.T. dates in conjunction with those of the Scottish Six Days Trial:

"From a Scottish rider's point of view, the dates arranged for the 1922 T.T. races are rather unfavourable, as we have the Scottish Six Days Trial in the first week in May, and the next three weeks would need to be spent in the Isle of Man practising, etc. This would mean nearly five weeks away from business at a very busy time."

MESSRS. S. A. NEWMAN, LTD., of Ivy fame, write:

"We consider that it is very unfortunate from a manufacturer's point of view, as we ourselves can ill spare our mechanics and staff away from the works just prior to the Whitsuntide holidays, and we would very much prefer the date of the Junior race, in which we are interested, to be held the first week in May, if at all possible. This date, we think, would cause manufacturers the least possible dislocation of labour and the smallest loss of output."

MESSRS. W. J. GREEN, LTD., makers of Omega motor cycles, write:

"We quite agree with your remarks that the alteration would cause unnecessary trouble to manufacturers, because, as you state, the date proposed comes in the busiest period of the year, and in even a slack time there is much dislocation in the factories, and standard output is retarded."

T.T. Dates.—

In our opinion, the date of the T.T. should be placed as far into the latter part of the season as practicable. We think you merit the thanks of the trade for bringing this matter up."

OSWALD WADE, an A.J.S. rider and an agent in Liverpool, says:

"I think it is a bad time to hold this race, as it will interfere with the holiday trade for the manufacturers and agents. I quite agree with your opinion."

THE 1922 BEDELIA.

THE Bedelia owes much of its fame to the fact that it was the machine which inaugurated the cycle car proposition of a decade ago. As our readers will remember, the very simplicity of the type tempted many pseudo-designers and amateur constructors to enter the automobile industry, with results disastrous to themselves and the term cycle car generally. It served one good purpose, however, and that was to show car manufacturers the enormous field which existed for a light four-wheeler on sound mechanical lines, and the present-day small car and its larger sister the light car proper are the outcome.

Very few of the pioneer manufacturers of belt-driven cycle cars have retained their original principles. The maker of the Bedelia is one of the exceptions, and

of discs of different diameters carried on the end of the countershaft. In other words, line contact friction drive is used which, theoretically, is more efficient than the principle adopted when friction transmission is applied to automobiles.

For declutching, the countershaft is pressed away from the flanges on the engine shaft by means of a pedal, and the change of gear is obtained in the ordinary manner by a change-speed lever. An idler wheel is employed which produces the reverse. There are belt pulleys mounted on both ends of the countershaft,

The braking is also interesting. Full movement of the clutch pedal presses the larger of the disc wheels against a stationary leather shod brake shoe, while

(Left) The new Bedelia cycle car which has been much improved in outward appearance, (Above) Power unit showing the V twin air-cooled engine and the friction disc gear.

his 1922 model, which we examined at the Paris Salon, is to be offered to the British public by Messrs. Palmer's Garage, Ltd., of Tooting, S.W.

Situated in the forepart of the vehicle the engine is a "Train" with a bore and stroke of 85×99 mm. respectively. The engine-shaft is extended and arranged so as to drive two different size discs on a shaft coupled to the main shaft by means of a universal joint. These discs can be brought into contact at will with a set

and from these to the rear wheel the drive is by two 17ft. belts.

The system of steering is particularly ingenious. There is a peg pinion at the bottom of the steering column which meshes with holes in two quadrants, each quadrant being mounted on a separate cross-shaft, at the end of which are the coupling rods to the steering arms. When the wheel is turned one quadrant is pushed forward and the other is pulled back, the steering being irreversible.

the braking of the rear wheels is obtained by pushing forward the brake lever, which has the effect of advancing the axle and pressing the belt rims against stationary shoes. Movement of this lever in the reverse direction tends to tighten the belts. Staggered seats are provided. The vehicle under review was driven under its own power from Paris to the coast, and we are told surmounted Gaillon Hill comfortably on second gear.

LONDON-GLOUCESTER TWELVE HOURS RUN.

QUITE a good entry has been received for next Saturday's open trial of the N.W. London M.C.C., which consists of a fairly straightforward twelve hour run to Gloucester and back. This will be the seventh anniversary of the event.

The start and finish will take place at the Hendon Aerodrome, instead of Hampstead Heath as in former years—this in deference to the restlessness of the police. The route is over main roads as far as Tring, where is the first time check. The next twenty-

five miles form the kernel of the whole trial. It is a non-stop section, and leads over some moderately difficult hills in the Chilterns, finishing near Aston Rowant. There will, of course, be no difficulty in maintaining a twenty-mile schedule in dry weather, but if there should be anything like real winter conditions some care will be needed to keep to time. Thence onward to Gloucester there will be no trouble.

On the return journey practically the same route is followed, but the non-stop section is only about thirteen miles, and

will, of course, be ridden in the dark. Competitors are diverted as compared with the morning route through Missenden, Amersham, Rickmansworth, to Watford.

The approximate time as passing different points will be as follows:

Start Out.		Restart Home.	
A.M.		P.M.	
8.0	Hendon Aerodrome	2.54	Gloucester
8.27	Watford	5.31	Oxford
9.0	Berkhamsted	6.46	Princes Risborough
9.18	Tring	7.22	Amersham
9.57	Princes Risborough	7.46	Rickmansworth
11.14	Oxford	7.58	Watford
P.M.		8.25	Hendon Aerodrome
12.5	Faringdon		
1.2	Cirencester		
1.54	Gloucester		

AFTER you Buy...?

".....Apart altogether from their merits as designers and manufacturers, it ought to be more widely known that *Bakers' are nice people to Deal With.*"

*Extract from a Letter from
Mr. A. Ramsay, of Fort William, Nov. 24, 1921*

There are few manufacturers who give you as prompt and generous service after you have bought, who show the same personal interest in you as the makers of the Beardmore-Precision.

We have built our business upon a basis of Service-after-Sale. Frankly, and sentiment apart, service is a sound business proposition—as you have so often urged in writing to "The Motor Cycle."

The same applies to our agents. No agent is appointed to sell the Beardmore-Precision unless he is fully prepared to look after customers as keenly as he follows up enquirers.

It is not enough for you to be convinced of the wonderful value and service given you by the machine itself. We want you to know that you are safe in dealing with the makers, too. You are well looked after indeed when you join the band of Beardmore-Precision riders.

Why Universal?

**Schrader
Universal**
BRITISH MADE **TYRE VALVE**

is universally used because it can be easily inflated or deflated, can be easily tested with a Tyre Pressure Gauge, is proof against neglect to tighten up caps and nuts after or during inflation, has no joints to leak, and is secure against ignorance, rough usage, or neglect.

There are 30 million of them in use. "Insides"—standard for all types and sizes of valves—can be had of all good dealers, in neat dust-proof boxes containing five.

A. SCHRADER'S SON, INC.,
British Factory : Victoria Road, London, N.W. 10
Manufacturers of the "Schrader
Universal" Tyre Pressure Gauge.

Be sure it's a "SCHRADER"—Look out for the name.

Sydney R. Jones

Silencers for Attachment to Open Exhaust Pipes.

Auxiliary silencers that may be fitted to existing exhaust pipes are becoming very popular. We illustrate two patented designs which have given satisfaction. (Top) Internal drilled cones act as baffles in the silencer made by the manufacturers of the Ready motor cycle. (D. Read and Co., Orchard Street, Weston-super-Mare.)

(Bottom) A type that comes apart longitudinally for cleaning purposes. (W. J. Ritchie and Co., Freedom Works, Sheffield.)

Both are marketed in various sizes for different engines

Dissipating Excessive Heat.

Aluminium valve caps, always popular and effective, are, nevertheless, liable to blow out. To overcome this, Eli Clarke, the well-known competition rider, of Cheltenham Road, Bristol, is marketing the auxiliary device shown above, which holds itself into the recess of a standard valve cap. It fits many types of engines, and has almost the cooling properties of the all-aluminium cap. (4s. 6d.)

Neat Spring-up Stand.

Embodying an enclosed "clock spring," this fly-up rear stand is marketed by Crado, Ltd., 26, Cross Street, Hatton Garden, London, E.C.1. The tension of the spring is adjustable by means of the cap-nut and split-pin

Dual Clutch Control.

Owners of touring model Sunbeams will be interested in this foot control marketed by the Endrick Engineering Co., 26, Water Lane, Watford, specially for these machines, although several other makes may also be fitted.

Armouring the Tube.

Overlapping metal scales mounted on webbing interposed between two canvas strips form a puncture guard in the tube protector sold by A. Stuart Morris and Co., 101, Leadenhall Street, London, E.C.3. A portion of the shield is shown with the top cover rolled back.

Conversion to Twist Grip Control.

Already described in these pages, the Pidco twist grip control has now reached the production stage. The grip itself actuates the throttle and the knob controls the extra air. Norrish and Pidcock, Lonsdale Chambers, 27, Chancery Lane, London, W.C.2, are the makers

Superseding the Tool-bag.

Two neat ideas of carrying tools and small spares. (Left) A box type of foot-board made in two sizes by A. J. Woolley, Blankney, Flanshaw Lane, Wakefield. (Right) A three tray box in which the articles are held in specially shaped recesses in rubber. This case (the invention of E. C. Hill, Mengkibor Rubber Estate, Keluang, Johore, Malay States) may, with a padded top, be used as a pillion seat.

Road Tests of New Models

THE 3 1/2 h.p. FOUR-VALVE TRIUMPH.

ENGINE: 3 1/2 h.p. (80.94 x 97 mm. = 499 c.c.) with four overhead valves.

CARBURETTER: Triumph, two-lever, semi-automatic.

GEAR BOX: Triumph three-speed, multi-plate clutch and kick-starter.

TRANSMISSION: Oil-bath primary chain; protected rear chain.

TYRES: 26in. x 3in. Dunlop.

BRAKES: Dummy bell rim rear, horse-shoe rim front.

FORKS: Druid.

WEIGHT: Approximately 240lb.

PRICE: £120.

IN many respects the new four-valve sporting Triumph is unique.

Before taking it over for a road trial, we confess that we expected to find, excepting the super-efficient engine, almost a replica of the chain-driven "four" fitted with T.T. handle-bars. The writer has had considerable eminently satisfactory experience with the latter model, and, since many of the details—gear box, transmission, control, etc.—are common to both types, the supposition was an excusable one, and the revelation was consequently all the greater. The o.h.v. 3 1/2 h.p. machine is as different as an anti-aircraft gun is from a trench mortar.

In "feel" and in performance alike it is all that the often loosely-applied phrase "sports model" should signify; and, as those who have followed the descriptions in past issues (June 2nd and October 27th) will realise, it is as sturdily built, adequately tyred, and accessible as the hardest riding and least mechanical motor cyclist could desire.

Riding Position.

On first sitting astride the machine, the excellence of the riding position is at once apparent. The footrests are low down and well back, and just the right amount of the rider's weight is thrown on the slightly dropped handle-bars. Knee grips are now possible, for, since our first description of this model, the gear

quadrant has been moved to the fore end of the tank as on the I.O.M. Triumphs. The rear brake pedal, however, might with advantage be extended more towards the foot, although old Triumph riders will have no difficulty in finding it at any time.

The standard decompressor is fitted, but the priming tap has been dispensed with; raw petrol may be sucked into the cylinder by opening the throttle fully, shutting the air right off, and kick-starting once or twice. By this means an easy start is ensured on the coldest morning. Incidentally, the slipper type of aluminium piston fitted does not gum up so readily as a cast iron one. Ignition should be fully advanced when starting on the decompressor, but should be retarded before the lever is dropped. Which brings us to another point worthy of note.

Full use should be made at all times of the ignition control. The engine, as any high-efficiency power unit should be, is very sensitive to variations of the firing point, and slight grades or slow speeds call for a corresponding amount of retard in the ignition setting. This need for sensible driving is accentuated by the high top gear ratio—4.23 to 1, with 3in. tyres.

Carburation and Gear Control.

Since the Triumph carburetter is to all intents and purposes semi-automatic, the air lever may be left open practically all the time, but

Twin inlet and exhaust valves in this case do not necessitate complicated rocker gear; four dust-proof ball bearings are used.

Road Tests of New Models.—

here, again, the o.h.v. engine is slightly more sensitive than the side-valve pattern.

All plate clutches which run in oil are inclined to drag slightly until the lubricant warms up, and it has already been remarked in these columns that, in consequence, gear changing on first acquaintanceship with this particular gear box is just a little awkward. This, however, need worry no one, for very shortly one learns to operate the gears up and down with the utmost facility and absence of noise. At the same time, if the weather be at all cold, the beginner is recommended to place his toe on the brake pedal before engaging first gear.

Once under way, second gear may be engaged early, but, to enjoy the thrill of real acceleration, top should not be brought into action too soon. On the 7.02 to 1 middle ratio, one is advised to grip tightly before opening out! A momentary closure of the throttle just previous to pushing the gear lever right down, of course, ensures a much smoother change.

Comfort and steering, attended to by 26 x 3in. tyres and Druid forks, are all that could be desired from a rigid frame machine; nor do the large tyres appear to affect maximum speed to any serious degree. No speedometer was fitted to our machine, but on the one occasion that road conditions permitted full throttle—for about twenty seconds—we have no doubt whatever that we appreciably exceeded the elusive "sixty." There was no tendency to wobble.

Speed Capabilities.

However, a fairer criterion of the machine's all-out capabilities is afforded by the well-authenticated fact that one of the production models to standard specification has lapped at Brooklands at 68 m.p.h., which, in effect, means that it has exceeded 70 m.p.h.

It should also be remembered that the racing four-valve Triumph holds the 500 c.c. hour record at 76.74 m.p.h.; it is fairly obvious that a racing setting to the carburettor or a racing carburettor and the application of a little tuning, and the production model might be even further livened up—although this would certainly not be advisable in the case of nine riders out of ten.

More remarkable is the petrol consumption of the machine in its present form. Averaging from 20-25 m.p.h.—a very pleasant, slow "ponk-ponk"—the consumption is nearly 120 m.p.g., which is a notable instance of theoretical high efficiency design proving itself in practice. Four valves in a hemispherical cylinder head, ultra light reciprocating parts, and thoroughly adequate cooling, are, it will be recollected, salient features of the Ricardo design.

It is likely that twin tail pipes will be fitted to the silencer on all future models; with these the exhaust note may only be called noisy at high speeds. The valve gear, too, is surprisingly silent.

Hill-climbing and Braking.

There is little need to enlarge on the other qualities of the machine. Acceleration and hill-climbing on top gear are better than we expected, which is saying a good deal; and the brake is known to every Triumph rider. The horseshoe type front rim brake is retained for emergency use, and, as the writer has vivid memories of a lone descent of Alt-y-Bady at its greasiest with the aid of this fitment, he is not going to quibble with its retention. It is among the best of its type.

Nothing in this world is above criticism; we leave our readers to judge the seriousness of such imperfections as occurred to us. (1.) There is considerable piston slap, especially when cold; but few aluminium pistons are quite free from this. (2.) There is none too much ground clearance, especially under the footrest bar when cornering; in the case of a violent upset, say, in a freak trial, there seems a possibility of the left footrest puncturing the oil bath chain case. (3.) Since the float chamber is on the right of the jet, the machine cannot be propped against the left kerb without turning off the petrol. (4.) It was suggested in our correspondence columns recently that the plug was very inaccessible. Now, although two special spanners—box and cranked—are supplied, it is still none too easy to remove the plug when hot without burning one's fingers.

Little more need be said. Triumph finish and Triumph workmanship are in evidence in every detail.

With the gear lever in the "I.O.M." position—right forward and permitting knee-grips—and footrests well to the rear, the sporting Triumph now really fits the speedman.

AMERICAN FOUR-CYLINDER DESIGN.

Improvements to Power Unit and Detail Finish of the 1922 Henderson.

A FOUR-CYLINDER motor cycle always arouses interest, but, apart from this, the latest model Henderson, a make of machine which has been known in this country for some years, is a thoroughly attractive mount. The new model has the 1,301 c.c. engine placed lower in the frame and more rigidly held, and the four straight-down exhaust pipes are led into an expansion chamber. The carburetter is a Zenith, provided with a hot-air muff, and the valves are now of the side-by-side pattern. The radiating surfaces on the cylinders have been greatly increased, and a clear air passage is left past the ports and along the longitudinally arranged fins on the cylinder heads. While there are numerous fins around the exhaust port, these are totally absent round the inlet, a practice which

The new pattern four-cylinder Henderson. Note the exhaust muff round the rear exhaust pipe for heating the air to the carburetter.

Method of driving the magneto and dynamo, the latter being situated above the former.

was carried out on more than one engine at the recent Olympia Show.

The method of mounting the lighting dynamo immediately above the magneto, both units being held by the same clamping arrangement, is particularly neat. A

universal joint is interposed between the timing gear and the magneto spindle, and on this latter is the Splittorf dynamo drive pulley, which is adequately protected by a guard.

Mechanical Oiling System.

Lubrication is effected by a rotary oil pump, which forces the oil to the main bearings through a hollow crankshaft to the big end bearings, following automobile practice throughout; the same system is employed to lubricate the clutch bearings. Sufficient excess of oil is delivered into the connecting rod bearings to pass through them and be thrown by centrifugal force on to the cylinder walls.

Another noteworthy feature of the 1922 Henderson is the greatly improved finish. The braking system is particularly well carried out, and the braking surfaces are of ample dimensions. The outside band

brake is $1\frac{1}{2}$ in. wide, and is controlled by the right-hand pedal; the other brake is of the internal expanding pattern. The mudguards are exceptionally wide, and $27 \times 3\frac{1}{2}$ in. tyres are fitted.

The Henderson is one of the few machines which can be fitted with a gear box giving a reverse, which is undoubtedly an advantage when a sidecar is used. This reverse is an extra, and is controlled by a separate lever. Other features are a substantially built kick starter and a clutch, which is controlled either by a pedal or by the usual American practice of a long lever adjacent to the gear lever and working on the outside of the gear quadrant. Throttle control is, of course, by twist grip.

This machine is handled in this country by Melchior, Armstrong, and Dessau, Ltd., 14, Great Marlborough Street, London, W.1.

The 1922 International Six Days Trials.

SWITZERLAND offers the finest facilities in the world for a motor cycle test, and the success of the Swiss team in the 1921 International Six Days Trials has resulted in the decision to run the event again next year in that beautiful country. This decision was made at the F.I.C.M. meeting at Geneva, and was confirmed again at the last meeting of that body in Milan, when the 1922 route was shown and approved.

Though covering a good deal of the ground traversed last August, there are several important alterations in the route, one of the most startling being the proposal to run part of the course through the Canton of Grisons, which has only seen motor cars during the war, as the peasant population has set its face against any invasion of self-propelled vehicles.

This year the trial will again start from Geneva, and will on the first day take, in the morning, the Col de Marchairuz, and will pass through the pretty Jura country, and finish for the day at Chaux-des-Fonds. The next morning will include the famous Weissenstein Hill, so sportingly referred to by Hugh Gibson (to whom it brought disastrous results

last year) as the finest hill he had ever attempted. Lunch, as before, will be at Laufen, near the falls of the Rhine, an exceedingly beautiful spot. Afterwards, Basle will be skirted on the way to Zurich.

Into the High Alps.

Now comes the third day's run, which marks the entry into the high Alpine districts. Should the inhabitants of Grisons refuse to welcome the competitors, the Klausen Pass will again be surmounted—a wonderful piece of engineering. Lunch will be served at Altdorf, and the St. Gothard will be again climbed, following the same route as last year to Lugano.

The next day, Sunday, will be a day of rest, but the competitors will have the opportunity of watching the famous Monte Bre hill-climb.

On the fourth day the St. Gothard will again be climbed and the same route followed to Altdorf, after which the whole of the northern shores of beautiful Lake Lucerne will be traversed, and the day's run will terminate at Berne. This is over quite new country; and, on the morning of the fifth day a start will be made towards

Interlaken along the shores of Lakes Thun and Brienz to Meiringen, when the Grimsel Pass will be climbed in the reverse direction to last year. From its summit there is a magnificent view of the Rhône Glacier nestling up against the Furka Pass, which will not be climbed, as this year the Rhône Valley will be descended, breaking new ground, and the course will continue right down to Martigny and on to Aigle, from which a circular trip will be taken. The night will be passed at Château d'Oex, and the morning of the sixth day will be marked by a hill-climb over the Jaun Pass, and the circuit will be completed by Zweisimmen; over the Col du Pillon and back to Aigle.

The head of Lake Geneva will then be traversed, a slight *détour* made to Chatel St. Denis, and the remainder of the journey will be along the northern shores of the Lake of Geneva, over the hill called La Donzelle almost into France. At the end of the day will be the flying kilometre speed trial at Eaux-Mortes, the trial finishing at Geneva.

The date of August 3rd to 9th has been chosen for this so as not to clash with any other important event either on the Continent or in England.

J. A. NEWMAN

PASKELL CUP TRIAL

MR. J. A. NEWMAN, RIDING A STANDARD
"SPORTS MODEL" DOUGLAS, MADE THE

BEST SOLO PERFORMANCE

SECURING THE

BATES TROPHY

AND

MEDAL

Out of 95 STARTERS only
5 "CAME THROUGH"

*Mr. Newman's was one of the only
two solo machines of these five.*

It is now common knowledge that the wonderful Douglas "Sports Model" has excelled in the fields of competition, beyond all expectations, during the past year; every potential competition rider or sporting Motor Cyclist should not hesitate in making this Mount his choice for the coming season.

Its features incorporate:—

DETACHABLE CYLINDER HEADS—OVERHEAD VALVES
—TWIN SHOCK ABSORBED ALL-CHAIN DRIVE—A
DUPLEX CRADLE FRAME—INTERCHANGEABLE AND
QUICK—DETACHABLE LIGHT CAR TYPE WHEELS,
AND 650×65 TYRES—A THREE-SPEED BOX, CLUTCH,
AND KICK-STARTER, AND MANY OTHER MODERN
REFINEMENTS.

Its Price, complete with all Lamps, Horn, Licence
Holder, Tools, and a full equipment, is:

£130

DOUGLAS MOTORS, LTD.

Kingswood, BRISTOL

and

39, Newman Street,
LONDON, — W.1

Have you seen the New $3\frac{1}{2}$ h.p. Connaught?

Generates much more power than the old $2\frac{3}{4}$ h.p.—two strokes perfectly and is fitted with three speed gearbox and all-chain transmission. Lubrication is effected by automatic drip feed and petrol system.

In the

CONNAUGHT Two-Stroke

nothing is left to chance.

The machine is powerful, foolproof, and remarkably economical to run and will stand up to heavy work all day.

Price with Sidecar £95
Solo Models from £45.

SPECIFICATION:—Sturmey-Archer 3-speed with kick-starter; Amac carburetter; all-straight tube frame; saddle design, oval shape, specially strong tank; front and rear stands; strong aluminium chain covers; Quadrant coach-built sidecar.

DELIVERY AT ONCE.

CATALOGUES FROM:

MARCH NEWARK & Co., Ltd., 45, Lawley St., Birmingham.

London Agency: Clifford Wilson Manufacturing Co., 177, Westminster Bridge Rd., S.E.1.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

COMPRESSION RATIO.

? What is to be understood by the term "compression ratio"?
—H.J.E.H.

Compression ratio is the relation between the capacity of the cylinder head when the piston is at the top of the stroke and the capacity of the cylinder head plus the swept volume of the cylinder when the piston is at the bottom of the stroke.

PRESSURES IN THE CYLINDER.

? Taking the average $5\frac{1}{2}$ h.p. four-stroke single-cylinder machine: (1.) To what pressure, by gauge, is the gas compressed before ignition? (2.) To what pressure, by gauge, does the pressure rise by combustion, e.g., immediately after ignition? (3.) What is the pressure when the exhaust valve opens?—T.D.

(1.) This depends on the compression ratio, but is probably between 60 and 80 lb. to the square inch. (2.) Approximately 300 lb. maximum. (3.) This depends very largely upon the timing of the exhaust valve, and might be anything between 70 and 45 lb. to the square inch.

VARIOUS QUESTIONS REGARDING A TWO-STROKE LIGHTWEIGHT.

? (1.) I have a Sparkbrook-Villiers (Mark IV. engine), two-speed gear (engine sprocket, fifteen teeth; countershaft sprocket, thirty teeth), and as I am wanting the new Villiers clutch fitted, and the smallest engine sprocket which can be fitted with that is sixteen teeth, would a larger countershaft sprocket (I suppose thirty-two teeth) make the gears the same as at present, viz., 5 to 1 and 9 to 1? (2.) I also have had trouble with my plugs oiling up, although no sign of over-oiling, such as four-stroking or smoking. I have been recommended to use a "spark intensifier" as a cure, but would this be detrimental to the magneto? (3.) Can a 24in. cover be used on a 2in. rim?—H.E.

(1.) If you wish to keep the gear ratio the same it would be necessary to fit a thirty-two-tooth sprocket on the countershaft, but we do not think it will be necessary to make this change. (2.) The use of spark gaps certainly tends to eliminate trouble from over-oiling on the sparking plugs, and it is not likely that the magneto will be damaged, provided that the gaps are not too wide. (3.) A $26 \times 2\frac{1}{2}$ in. cover can be used on a 26×2 in. rim.

Important Dates.

Sat., Dec. 31st—N.W. London M.C.C. Twelve Hours Open Winter Trial.
Fri., Jan. 27th, to Sat., Feb. 4th—Scottish Car and Motor Cycle Show.
Sun., Mar. 5th—Argenteuil Hill-climb (France).
Mon., Mar. 6th—La Turbie Hill-climb (Nice).
Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.
Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.
Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.
Sat., April 8th—B.M.C.R.C. Members' Meeting at Brooklands.
Fri., April 14th, and Sat., April 15th—M.C.C. London-Land's End Run.
Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.
Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.
Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.
Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.
Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.
Tues., May 30th—Junior Tourist Trophy Race.
Thurs., June 1st—Senior Tourist Trophy Race.

FITTING LARGER ENGINE IN LIGHT-WEIGHT FRAME.

? My Royal Ruby machine, with a $2\frac{1}{2}$ h.p. J.A.P. 1916 four-stroke engine, has just recently been fitted with a sidecar. The engine appears to labour under the weight, so I should be glad if you would say whether it could be replaced by a larger one without any alterations being made to the frame, thus saving expense in buying a more powerful machine. The frame seems to be quite strong, and capable of taking the strain.—H.J.W.

It would not be advisable to fit a single-cylinder engine of larger capacity than 350 c.c. in the frame of your machine, but there should be no particular danger in fitting a twin-cylinder engine of up to 500 c.c. provided you did not indulge in excessive speeds with the sidecar outfit. Possibly you would obtain better results from your present engine if you lowered the top gear ratio, but no doubt you are aware that the particular engine fitted is not really suitable for sidecar work, having been designed specifically for solo machines.

BALANCING.

? Contemplating fitting an aluminium piston in my 4 h.p. 1914 Triumph engine, I should be much obliged if you could give me the rough rule for balancing. I understand that it is impossible to balance a single-cylinder engine accurately for all speeds; and, as my dealer will not tackle the job, I have decided, after careful consideration, to do it myself; am quite aware of risks, etc., and prepared for trouble.—A.M.

The rule for determining balance weights is generally given, roughly, as the total rotating masses plus half the reciprocating masses; but in the average motor cycle engine of the best type, the balance weight is, usually, the rotating masses plus approximately one-third to two-fifths of the reciprocating masses.

A FORGOTTEN MACHINE.

? Owing to a breakdown, a man left his motor cycle at my house, to be called for the following morning. Three months have gone by, but no one has appeared. (1.) Is it advisable to advertise it in some paper? (2.) Would I be able to claim the machine as mine if the right owner did not come for it in, say, seven days?—DOUBTFUL.

(1.) It would be advisable to advertise to the effect that if the machine is not claimed within a certain period it will be sold to defray the expense of storage. (2.) You should most certainly take every step to find the owner before you dispose of it. The registration number will enable you to get in touch, of course, through the agency of the police.

BLACKING THE CYLINDERS.

? Liquid blacklead is advertised for "those who like to blacklead their cylinders." Why should cylinders be blackened, for black is supposed to absorb heat? May I enquire how it is that cylinders are not whitened or aluminium painted, since white radiates heat?—J.H.R.

Ordinarily it is not likely that blacking the cylinders will result in overheating. Black certainly absorbs light and heat just as white reflects light. As the heat from the cylinder comes from within, the painting of the surface will not have any appreciable effect unless the paint is applied very thickly, or actually contains a non-conducting material. The majority of commercial cylinder blacks have no detrimental effect on the cooling.

MACHINE BURNT IN A PUBLIC GARAGE

? Early this year I left a motor cycle and sidecar in a local garage for some slight repairs. It was not insured; but, as far as I can learn, the garage and its stock were insured by the owner. Unfortunately, the garage was burnt, and several machines, including mine, were totally destroyed. The proprietor says the insurance company disclaims liability for machines left for repair, and he also disclaims all liability himself, although I have never seen an "Owner's risk" notice in any part of his garage. He promised me some slight compensation when the insurance company paid him over the premises. I have jogged his memory several times, but he always makes the excuse that the insurance people have not paid up yet; but I was informed recently on very reliable authority that his claim had been settled long ago. Now I should like to know my position. Am I to trust to this man's kindness of heart for compensation, or have I a reasonable chance of winning my case if I take it to court?—M.J.

Unless you could prove that the damage to your machine was caused by the negligence of the garage proprietor or his staff, you have no claim against him. It is not absolutely necessary for him to exhibit a notice disclaiming liability for loss or damage to machines stored on his premises.

OVERHEATING WITH A.I.V. ENGINE.

? In the issue of *The Motor Cycle* dated August 25th, page 231, you published a reader's suggested alteration from automatic to mechanical inlet valve operation for old engines. I am still running a 4 h.p. J.A.P. engine with automatic inlet, which is satisfactory in every way up to a certain temperature, when the power quickly falls to zero, but will recover after a few minutes' rest. The proposed alteration you illustrated still retains the totally enclosed inlet valve spring, which, to my mind, is the source of the falling off in power. The only advantage I can see in the sketch is that a stronger inlet valve spring could be used, but would not this suffer in the same way through being enclosed? It is the efficient closing of the valve that is at fault when the engine is too hot, not the opening (which is only what the mechanically-operated system overcomes). Would my engine be more satisfactory if the valve were lengthened and the spring placed outside?—V.M.

We cannot think that the trouble you experience with your machine is due to the inlet valve not closing sufficiently early. What actually happens is that the incoming gases become unduly heated before reaching the valve port; and, consequently, through expansion, the full charge is not drawn into the cylinder. If the spring is sufficiently strong to close the valve smartly—incidentally, it is helped by the compression as the piston commences to rise again—it is unlikely that the fact that it is enclosed has any tendency to heat it enough to cause loss of temper. The valve springs should be kept reasonably cool by the incoming charge in any case. There is no objec-

tion, however, to increasing the length of the valve stem and fitting an external spring, provided you make quite certain that there is no air leak in the guide through which the stem passes.

TOO MUCH ADVANCE.

? A 2½ h.p. Torpedo two-stroke which I have will not go; yet, to the best of my knowledge, I have tried every means. The cylinder was scored, so I had it filled in by the Barimar process. I have put new piston rings in, new bushes in the crank case and the connecting rod big and little ends, overhauled the magneto and carburetter, and stopped all possible air leaks; still it is the same. It is a fixed ignition magneto, and I have timed the spark to occur 7/16 in. before top dead centre. All I can get out of it is an occasional explosion, but there is no power; and it stops dead.—A.A. The only obvious fault mentioned in your letter appears to be the ignition timing, which is much too far advanced for a magneto with fixed firing point. Time the spark so that it occurs about 1/16 in. before top dead centre.

The Norton Cup, presented by Norton Motors, Ltd., to the British Motor Cycle Racing Club for the best aggregate performance by a private member during 1921. The winner of the cup is Mr. Eric Longden.

TWO-STROKE CARBURETTER ON FOUR-STROKE.

? Will a two-stroke carburetter function satisfactorily if used on a four-stroke engine?—F.F. Yes; a carburetter from a two-stroke machine will usually answer quite well on a four-stroke of the same capacity, although variations in jet and choke sizes may be necessary.

NO TAX REBATE ON OLD MACHINES.

? Am I entitled to claim a rebate of 25% of the duty payable on a pre-1913 motor cycle? I enclose correspondence I had from the local licensing officer, wherein he points out that motor cycles are not entitled to the rebate, and also a copy of the original registration dated 1912, in which the term "Description of car" is used. My opinion is that it is quite logical and commonsense to expect the rebate to apply to motor cycle engines as well as to motor cars.—A.A.B.

The rebate of duty on engines manufactured prior to 1913 is applicable only to cars which are taxed on h.p. As motor cycles are taxed on weight and not on power, we do not agree with you that it is quite logical to expect the rebate to apply to motor cycles also.

GEAR RATIOS AND TIMING.

? I have now a 3½ h.p. two-speed Alec to with gears 2½ to 1 and 8 to 1. What timing do you advise for tip-top speed? When on top the engine fires as a slow four-stroke. Can this be cured?—W.R. We think that you make some mistake when you say that your machine has gears of 2½ to 1 and 8 to 1. We certainly should not recommend you to use a higher top gear than 4½ to 1, if you wish to get a maximum speed out of your machine. Time the ignition so that the spark occurs when the piston is on top dead centre with the magneto fully retarded. Four-stroking is generally caused by over-rich mixture or too much oil.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.

"P. and M." (Haworth).—Binks carburetter and 28×3½ in. tyres on R.A.F. model P. and M.

"H.K.R." (Manchester).—Maglita set on Triumph: Light at low and high speeds, ignition and general reliability.

"F.S." (Oldham).—Ner-a-car: Flexibility, speed, consumption and acceleration; reliability on long climbs and touring.

"S.A.R." (Southsea).—Puncture-preventing materials and devices, i.e., Pmkho, Improvo, tube protectors, etc.

"J.D.W." (Micheldown).—Dunelt and 2½ h.p. sporting A.J.S.: Reliability, finish, service m.p.g., m.p.h., etc.

"L.F.P." (Birmingham).—Edmund and Coulson: Blackburne-engined machines: Lateral play of springing devices after prolonged use.

SPARKLETS.

Technological Students Visit Cycle Works.

Three parties of students from the Manchester Institute of Technology, including one lady and several members from India, Japan, and other overseas countries, recently visited the works of the Ruby Cycle Co., Ltd., at Altrincham. Much interest was shown in the modern factory equipment and methods used in the production of Royal Ruby cycles and motor cycles.

Lighting-up Tables.

Referring once more to the ivory lighting-up tablets given away by H. Taylor and Co., Ltd., of 52-53, Sussex Place, South Kensington, London, S.W., several recipients have pointed out that the times given are incorrect; this is not quite accurate, as the times stated are given to conform with the Road Vehicles Licensing Order of 1921, which requires the number plate to be illuminated half-an-hour before the driving lights are actually required by the law.

Catalogues Received.

E. Showell and Sons, Ltd., 14, New Street, Birmingham: A handsome book, with large and well-displayed pages, detailing the advantages and the various forms of the Showell rotary mechanical oil pump.

SPARKING PLUGS

7/8 STANDARD KLG 'G' SERIES

Type G 1—for average engines—standard metric thread,
12 m/m reach.

Type G 2—for average engines—standard metric thread,
18 m/m reach.

Type G 3—for American Cars taking A.L.A.M. threads,
1/2 in. reach.

Type G 4—for American Cars taking A.L.A.M. threads,
3/4 in. reach. Suitable for the latest 'Buick' Cars.

Type G 5—the popular 'Ford' model, and for American
Cars taking 1/2 in. gas thread.

THE DESIGN OF THESE PLUGS INCORPORATES THE FOLLOWING NEW & UNIQUE ADVANTAGES—

A. The plug body and gland nut, which constitute the permanent portions of the plug, are treated by a special process before assembling which renders them rust-proof and absolutely obviates the not infrequent trouble caused by the plug "seizing" in the cylinder.

B. The central electrode and insulation can be readily removed from the plug by unscrewing the gland nut without the necessity of removing the plug body from the engine cylinder. This renders possible the inspection and thorough cleansing of the insulation.

C. Complete "centres" for renewals can be supplied and carried as spares. With ordinary care the original plug body and gland nut should last almost indefinitely.

RETAIL PRICE OF ALL 'G' TYPES
IS **6/-** EACH
SPARE INSULATED CENTRES **3/-** EACH

No More Punctures!

You will never again be stranded with a punctured tyre — never again dread bits of glass, flint, and nails, if you fit the **TUBE PROTECTOR**.

The Tube Protector is a flexible layer of thin pieces of hard metal (arranged as in a coat of mail) enclosed in canvas, and fits between the outer cover and the inner tube of your tyre. No matter what sharp matter pierces the outer cover, it cannot penetrate the Tube Protector — cannot possibly pass through to the inner tube.

The Tube Protector is easy to fit, is light in weight, and causes no friction. It allows you to wear down the outer cover to almost nothing. Think of the saving in time, money, labour, and patience.

Ask your dealer to fit **TUBE PROTECTORS** to your motor cycle tyres

Tube Protector

SUPREME COMFORT.

The Famous
"Blackburne"
Engine

Coulson

FOR COMFORT

But not for comfort *only*, for the Coulson is as *reliable* and as *speedy* as it is comfortable. And as for appearance, what could be handsomer? Its streamlined tank and silencer give it just that artistic individuality which makes so strong an appeal to discriminating tastes.

The Coulson is just the mount if you thirst for a "mad rush" along a deserted road. In 1920 the Coulson broke 9 World's Records, and its rock-like durability makes it *safe*. Its power unit is a Blackburne—the engine with the classic reputation—and the Coulson itself is constructed by A. W. Wall, Ltd., renowned as the firm with the *longest* experience in the trade.

If you have not seen a Coulson and felt its *extraordinary* comfort even on the worst of roads, you should do so at once.

MAPLESTONE

CANTILEVER
SPRING FORKS

The scientific accuracy of MAPLESTONE design guarantees its practical efficiency in use—greater comfort in riding and easier steering. Three features distinguish the MAPLESTONE Fork:—

1. Its cantilever principle of design combined with compression springing.
2. Its bearings, which are all bushed with phosphor-bronze and fitted with screw-down grease cups.
3. Its principal lugs, which are all steel forgings—not castings. Greater strength with lightness.

Specially note how the Fork's life is lengthened by No. 2 feature. In ALL other forks, wear eventually means costly scrapping—in the MAPLESTONE, only new bushes!

Ask your Agent about the MAPLESTONE—or write to

*A work which adds greatly
to the enjoyment of touring.*

"THE AUTOCAR" ROAD-BOOK

By Charles G. Harper,
The Historian of British Roads.

THESE books are much more than mere route books. Not only do they give the best routes from place to place, the distances between them, and the character of the roads, but also provide concise information regarding the lesser-known villages and hamlets, historical castles, ancient manor houses, beautiful cathedrals, and interesting rural churches that are to be found on or near the routes described. Motorists and other travellers, to whom the beauty, antiquity, or literary interest of wayside objects makes an appeal, will find them invaluable companions when on tour.

In Four Volumes:

- Vol. I. SOUTH OF THE THAMES.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words 3/-, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 10/-. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C., 1921, new condition; £78.—Clark, 7 Exhibition Rd., S.W.7. [2941]

All letters relating to advertisements should quote the number at the end of each advertisement, and the date of the issue. B2; Motor Cycles advertised by private owners are, when desired, marked (P).

PHILIPSON'S
PATENT AUTOMATIC GOVERNOR

PULLEY

AND GEAR COMBINED.

Philipson's Latest!

GOVERNOR PULLEY AND VARIABLE GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines.

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

2-stroke.

LEVIS,
O.K.,
CALTHORPE,
VILLIERS,
etc.

4-stroke.

TRIUMPH,
NORTON,
ROVER,
SINGER,
COULSON-
BLACKBURN

We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.

Our Flywheel Governor converts a single-speed 2-stroke into a speed model—the lightest speed model on the market!

THE ONLY GEAR WITH NO END-THRUST.

IMMEDIATE DELIVERY.

Send for Illustrated Booklet

No gear box friction.
No grinding noises.
No wheels or pinions to chew up.

RELIANCE Magneto Repairing Co. for repairs and new magnetos.—See below.

RELIANCE guarantee to return your magneto within 3 days, and if necessary 24 hours, with a written guarantee for 12 months.

RELIANCE test every magneto after repair under all running conditions, and, as we contract for many of the largest concerns, you need have no hesitation in placing your repairs and orders with us.

RELIANCE manufacture and stock spares for Thomson-Bennett, E.I.C., Splitdorf, U.H., Bosch, Dixie, etc.; special live genuine platinum screws for every make, 12/- per pair.

RELIANCE will be pleased to give advice free of charge upon any question concerning ignition troubles, as we place our long-standing experience at your disposal, and old and new customers may be certain of getting the usual promptness and courtesy that we have always endeavoured to give.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1.

RELIANCE Magneto Repairing Co., 283, St. John St., E.C.1, for new and second-hand magnetos.—See below.

THOMSON-BENNETT Magnetos, new and unused, single-cyl., clock and anti, suit any machine, price 55/-; twins, 45, 48, 50, 55, 60, 180 degrees, for J.A.P., Clyno, Douglas, etc., price 55/- See our guarantee.—Below.

C.A.V. Magnetos, new, single-cyl. and 180° twins, clock or anti, ideal for Douglas, Lewis, Calthorpe, O.K., or any lightweight; these magnetos are of the finest workmanship throughout; price 55/- See our guarantee.—Below.

BOSCH D.A.L. Magnetos, soiled only, otherwise as new, single cyl., suitable for any stationary engine or big single, £2/15; twins, any degree, ready to drop on Indian, Harley, or any big twin, £4/5; a powerful spark at low speed, ensuring easy starting. All the above magnetos are variable ignition and fitted short-circuiting switch. See our guarantee.—Below.

GUARANTEE.—Every magneto that leaves our works, no matter what the price or make, carries a written guarantee. Not merely a guarantee that same is in good order at time of sale, but a plainly written statement that we guarantee every machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors.

RELIANCE Magneto Repairing Co. hold one of the largest stocks in London, and can be depended upon for a straight deal at the right price. When buying it pays to deal with a firm of repute.

RELIANCE cordially invite customers to their works to see any of the above on test. Magneto list giving full particulars sent upon application.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1. [6616]

£210 0—1921 10 h.p. ACE , 4-cylinder, 3-speed, clutch, and kick-starter. This magnificent 4-cylinder machine going at almost half-price	£120 0

HOW IS IT DONE?

Where is the profit, you will ask.

We can assure you there is no profit, but a very considerable loss on our own cost on every one of those machines—but we sell such large numbers during the season that we can afford to lose on what are left over at the end of the year.

OUR LOSS IS YOUR GAIN IF YOU NOW SEIZE THE OPPORTUNITY.

ALEXANDER'S

113-115, Lothian Rd., EDINBURGH.

Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

Sir,
I beg to acknowledge receipt of yours of the 13th inst., enclosing cheque in settlement made in regard of my accident claim of October 18th.

I wish also to express my appreciation of the promptness with which your Company dealt with claim, and, where possible, shall always recommend "The Autocar" as a first-class Insurance Company.

Again thanking you,
I remain,
Yours sincerely,

The only Safe Test of Insurance is Claims. We settle Claims promptly.

L. & K. PASTE SOLDER

Combined Solder and Flux. Strength 50% 50. In Tubes, self contained. The simplest form of soldering.

A boon to the motorist—carry the tube in your pocket and make a good join on the road. Joins Bowden wires and nipples. No acids, flux, fire, or fumes required—squeezes out a little paste—apply the heat of a match or candle, and the repair is done. As supplied to H.M. Government.

Ready for instant use.—Per tube, 2/6 post free. Livermore & Knight, Ltd., 180, Fleet St., London

BATH IT!

REMOVE that naked driving chain and clean with paraffin. When dry, place in a flat pan in which sufficient Foliac Graphite Motor Chain Compound to quite cover chain has been melted. Allow chain to remain in mixture about 15 minutes, during which time move every link, which ensures the lubricant reaching all interior wearing surfaces. Then, when cool, replace on machine. Water, mud, or dust will not now affect it.

2/6 PER BAR.

If your garage does not stock it, we will supply you direct on receipt of name of your garage.

GRAPHITE PRODUCTS, Ltd.,

REPAIRERS.

GODFREY'S, Ltd., 208, Gt. Portland St., London, W.1, specialists in motor cycle repairs of all descriptions. Completely equipped workshops at 14, Miller St., Camden Town, N.W. (Phone: Museum 2434), which afford exceptional facilities for overhauls and repairs at moderate prices. Estimates given. [0639]

ACETYLENE and Electric Welding.—Broken flanges, cracked water jackets, scored bores, worn bearings built up; aluminium gear boxes, crank cases, any broken motor part welded and machined up and returned in 7 days; 14 years' experience.—Lincoln Jeffries, Jun., Gun and Motor Maker, 120, Steelhouse Lane, Birmingham. Phone: Central 729. [2818]

SPEEDOMETER Repairs.—Caution!—We beg to advise owners of Stewart speedometers that repairs can only be satisfactorily carried out by the makers, who alone possess the proper facilities for repair and subsequent necessary calibration of their instrument. We accept no responsibility for the working of instruments sent elsewhere which nullifies our guarantee.—The Cooper-Stewart Engineering Co., Ltd., 11, Broad St., Bloomsbury, London, W.C.2. [2950]

WE Specialise in repairs to N.S.U. engines and N.S.U. engine-shaft gears; our enormous stock of N.S.U. spare parts (having acquired the company's entire stock-in-trade and patterns) enable us to supply to suit practically all N.S.U. models, including the earlier types, fitted with Eisenmann L.T. mag., also for the 24hp. N.S.U. engines fitted to 1913-14 O.K. machines. In ordering, it is important to submit old parts as pattern; trade enquiries invited.—Eagles and Co., Acton Hill Works, Spares Dept., 275, High St., Acton, London. [0355]

IF only the best will satisfy you, then the Tennant Engineering Co., 239, Bristol St., Birmingham, alone can please you. Super-critical you may be, but their work will pass your inspection down to the last detail. No firm has more experience, no firm has keener workmen, no firm has greater or better facilities for turning out perfect work, and no firm will strive more to give you satisfaction. Cylinders rebores and fitted new pistons. Rebuilding of every description. Engines completely overhauled and returned full of vigour and trim. Frames altered and repaired. Everything fully guaranteed and at competitive prices. Official repairers to A.C.U. and R.A.C.—Phone: Mid. 1928. [0047]

Fork Facts

There is something more than mere coincidence behind the fact that

DRUID

Forks were demanded by T.T. Riders — replacing less efficient types in this supreme test —

That at Olympia the DRUID was predominant, and —

That riders everywhere to-day are "demanding" DRUID Forks.

There's a reason:—It is that expert and tourist alike KNOW that for perfectly-efficient shock-absorption the DRUID has no equal.

PROMPT "DRUID" DELIVERIES.

A. DREW & CO., LTD.

Birmingham.

The dual springs of the Mark II. model of the DRUID "The Fork the motorist demands."

R.R.S.

The Manufacturers of the CYKELAID MOTOR POWER UNIT FOR PEDAL CYCLES

beg to thank all readers of *The Motor Cycle* who have enquired for particulars of this production, and have to say that IN ORDER TO ENABLE THEM TO COMPLETE NECESSARY WORKS EXTENSIONS THEY HAVE DECIDED NOT TO SUPPLY ANY FURTHER UNITS FOR THE TIME BEING.

The CYKELAID, although very successful in its present form, will then be superseded by a stronger, simpler, and greatly improved Model at a LOWER PRICE.

All future productions will be guaranteed over a considerable period, and will be well worth waiting for. Prospective users are requested to watch for further announcements.

Sole Makers:

THE SHEPPEE MOTOR Co. Ltd.
59, Thomas Street, YORK.

Cut out waste of oil

A Tin of oil will last you twice as long, and you will have a more efficient engine, if you use a BEST Automatic Oil Pump.

One delighted user says, "I have not had the slightest trouble with it, and this, combined with a big economy in oil, easier starting, and smoother running, makes me more pleased with it every run I have."

Why not fit one to your machine? It costs only 25/6—plus cost of fitting

You can learn all about it from a free Book entitled "The 'Best' Way." May we send you a copy?

Are you interested in LIGHT CARS?

Readers of "The Motor Cycle" who are considering the purchase of a small car will find all the information they desire in the pages of

The Autocar

Every Friday.

FOURPENCE.

"THE AUTOCAR" deals with every phase of motoring, and very fully covers the small car movement.

All the known makes of light cars are advertised in "THE AUTOCAR."

Bargains in second-hand light cars are more likely to be secured through "THE AUTOCAR" than any other medium.

Because—

More second-hand light cars are offered for sale in "THE AUTOCAR" than in any other motor journal.

morning previous to the day of issue.

**This book has been specially
written for the man who looks
after the car.**

**THE
MAINTENANCE
AND
RUNNING REPAIRS
OF
MOTOR CARS**

by **ERIC W. WALFORD.**

THE author has for many years
made a practice of driving
and looking after his own
cars, and this book is the out-
come of his experiences. A care-
ful study of its pages will enable
anyone with limited mechanical
knowledge, or even with none at
all, speedily to master the details
of a motor vehicle and to take
entire charge of it with confidence.

IMPROVED TYPE

THE "RAY-O-NITE" SELF-CONTAINED MOTOR CYCLE ELECTRIC LAMP. A Great "VOLEX" Achievement.

Recommended for Home and Export. No accumulator, oil, or acid required; a brilliant light obtained at will. A successful self-contained motor cycle lamp such as the "Ray-O-Nite" is only rendered possible by the remarkable efficiency of the "Volex" Dry Battery, which is in a class apart from all other primary batteries. Comprising "Superba" Head Lamp (5 1/2 in. front), combined with a strong metal container holding the "Ray-O-Nite" Dry Battery complete with bulb. Ready for immediate use.

Revised Edition

(THE TWENTY-SECOND)

of

MOTOR CYCLES

& how to manage them.

The Standard Handbook on the Motor Cycle, its care and management.

MOTOR CYCLES AND HOW TO MANAGE THEM covers every conceivable subject relating to motor cycles, their care and management, and deals with every part of the machine and with all types of machines. It is a complete and reliable treatise on the multifarious matters that concern all motor cycle riders—selection and purchase of a machine, driving, tuning, upkeep, garaging, etc.

The book is plentifully illustrated from photographs and specially prepared line drawings.

Invaluable to the beginner who wishes to understand his machine, and a handy companion to the more advanced rider.

If you have a sidcar machine, consider the economy of buying a 5-gallon drum of oil for your season's requirements—the saving is considerable.

We have ready an interesting, illustrated leaflet showing how you can pour oil from a drum without spilling a drop.

The current Lists give the prices of oils in drums.
Please mention "The Motor Cycle"

The Ideal BOOT

for ALL-WEATHER RIDING
or for the Field and Garden
Perfectly New, absolutely Waterproof, and easy to slip on and off.
These boots are of far superior quality, and will give far more service than similar articles, of infinitely inferior materials, which are offered by other stores at slightly lower prices.

Officers' Field Service

TRENCH BOOTS

Our Price - **35/-**

Postage and packing, 1/6. In Brown or Black.
All sizes. Guaranteed to be made of the finest Government Leather. Sizes from 4 to 12. Smaller sizes suitable for ladies. These boots reach to the knee, and have full length tongues and side buckles, which effectively prevent any water penetrating through the lace holes or over the tops of the boots. The uppers are strong and stout, and yet extremely soft and pliable. **THE SMARTEST and MOST COMFORTABLE Trench Boots procurable**

"Ixon" knows how to keep dry!

"Finally I bought a first-grade suit of grey Oilskins made by Barbour's of South Shields, and found I could ride my 200 miles of a trial, stand in a steady downpour through two hill-climbs per diem, sit on wet grass banks when my legs wearied, and get into the hotel at night bone-dry; moreover, if the oils were hung up over night in a wall-less stable for the draughts to play around them, they were invariably bone-dry long before the first competitor got away next morning."

"Ixon," in his Occasional Comments—'The Motor Cycle.'
Money back in full if they go sticky, leak, or fall on any point

Beacon Oilskins

DON'T GO STICKY OR LEAK.

The Beacon Motor Cycling Suit will keep you as dry as it does "Ixon," and will enable you to drive all day against wind-driven Rain and Sleet without letting you get wet or chilled.

Black double lightweight Jackets with Windcuffs, double fronts, and two roomy pockets, **27/6** semi-buttoned Legging Overalls, **15/-**.

SUIT COMPLETE (post free) 42/6

In Bronze — Jackets **32/6**. Semi-buttoned Legging Overalls, **17/6**. Suit complete, post free, **50/-** with Seated Trouser Overalls in place of leggings, **55/-** and **62/6** the suit respectively.

Prices given are for Jacket length 33". For 36" & 39" length please add 2/6 and 5/- per jacket respectively. Overalls: Prices are for 28" to 33" inside leg, and for Seated Trouser Overalls up to 40" waist.

Postage Free U.K.; extra abroad. Allow also extra time for special Seasoning of Overseas Orders.)

J. BARBOUR & SONS, Ltd.,
26, Beacon Buildings,
South Shields, England. (1)

In answering these advertisements it is desirable to mention "The Motor Cycle."

Dec. 15th, 1921

page 832)

wrote as follows:

"PLUG POPULARITY.

Some painstaking individual counted all the sparking plugs fitted on the machines exhibited at Olympia, and his figures indicate that quite 62% were of Lodge manufacture, the balance being divided over fifteen other makes."

LODGE PLUGS

Standard equipment on the world's
leading motor cycles.

CAUTION.

There is a number of Government surplus Lodge plugs being offered for sale at very low prices. These plugs were made during the war for special aeroplane engines. In our opinion, they are unsuitable for motor car or motor cycle engines, because they will sputter up much more readily than our standard patterns. Purchasers of these plugs should note that we do not hold ourselves responsible in any way for the good working of these war surplus plugs, nor does our usual guarantee apply to them.
